We have received the first number of the eighth volume of this interesting paper. It is now under the control of friend Dewey, and has been enlarged to sixteen pages. We commend it to miners, stock dealers, and others taking an interest in the development of the mineral lands of this State. It can be had for $5 a year, and if preserved will make two volumes of interesting matter, containing 416 pages each.—*Red Bluff Independent*

The Reese River Mines.

NUMBER IV.

BIG CREEK DISTRICT.

South of Austin, about ten miles, is a large stream of water which takes its rise in the southern end of the Toiyabe Range of mountains, running north along the foot of these mountains some four miles, and then passing through a beautiful, broad, grassy cañon, westward, it sinks in the plain, about nine miles from its source. It carries about four hundred inches of water and flows steadily the year round, receiving its supply from several small branches and innumerable springs. For mill purposes it is one of the finest streams in the Territory, having a fall of about one foot to every rod throughout almost its entire course. Before the cañon became so populated, good sized trout were found in its gurgling waters. It was well called "Big Creek," and the district very properly named after it. Less than a year ago there were not a dozen houses in the cañon, and now there are no less than five thriving towns. The rapidity with which houses are springing up on every hand is wonderful; before the next winter they will extend from the sink to the head of the creek.

Lander City is just below the entrance to the cañon and about a mile farther up is Watertown, and next to this is Cañon City—all commanding a splendid view of the broad Reese River Valley, and the Smiths Creek range of mountains to the west.

Half a mile farther up the cañon is Mineral City, and a couple of miles more Montrose; indeed the houses are thickly studded along the Creek from Watertown to Montrose. I believe there is a greater proportion of good substantial, and comfortable dwellings here, than at Austin. Material for building is abundant, every hill being covered with pines of sufficient size to saw into lumber.

This district is in a very flourishing condition, and much enterprise has been displayed both in the improvements of every kind, and the amount of labor done on the various ledges. Every one has great faith in the richness and ultimate value of their mines when developed. All that the district now requires is more capital. It contains a great many fine ledges, some of which are of immense size and crop out so prominently that they can be seen for miles. One huge one, in particular, rising out of the afore mentioned Toiyabe range, towers to a hight of twenty-five or thirty feet, and presents a solid wall for more than half a mile. It can be plainly distinguished from the opposite side of the valley—a distance of sixteen miles. All the mountains in this district are very high and steep. Some of them are higher than Mount Davidson, and it is by no means an easy matter to ascend them. Two very high peaks are known as Mount "Moriah" and Mount "Pisgah."

There has always been a great deal of rivalry and jealousy between Austin and Big Creek, but in my opinion without any occasion. The districts are dissimilar in character and each presents its separate and peculiar advantages and inducements to capitalists for investment, and there is no doubt but both will yet receive their proper share of attention. Those who believe in the granite formation alone for good ledges, will go to Austin, while those who prefer slate formation and veins of some magnitude, will find all they desire at Big Creek. In the latter district some of the ledges are less than four feet in width at the outcrop, and from that up to fifteen or even twenty feet. Ore from many of them has been worked from time to time in the mills, and the results have always been satisfactory; the yield being from ninety to three hundred dollars per ton; and this, be it remembered, from surface ore, obtained from a not greater depth than twenty feet—in every instance. The rock is found richer as they go deeper, and should the veins at a depth of two or three hundred feet be found to increase in richness, as they will in width, then indeed will they be valuable mines. There is every facility for working them to advantage—by running in tunnels and piercing the ledges deep, thus draining the mine forever, and giving a body of ore overhead which could not be exhausted in years. Although several companies started tunnels to their ledges, none of them are in far enough yet, to reach the vein. Some of them have been obliged to suspend work for want of means to carry it on. Still much has been done and is doing which cannot be seen by a casual visitor. For instance, the Florence company have been steadily running their tunnel for a number of months, so also have the Olympic company. Both these companies have good ledges and will without doubt get good rock when they reach the veins.

The Toiyabe range is entirely distinct from the Shoshone range, although running parallel. It is about eighteen miles long and joined to the latter at either end, by low divides. It lies just to the east of Big Creek. The eastern slope goes down into Smoky Valley. The ledges found in this range are rather richer than the average of those found on the western side of the creek. Pieces of ore can be got from many of them, which upon roasting, the silver exudes freely. In at least two of them black sulphurets of silver have been found, at a little distance below the surface. I saw one from the Arizona last spring which contained argentiferous galena, chloride and black sulphuret of silver, and some carbonate of copper. This was very rich rock but unfortunately for the locators it proved to be a slide from the Seely ledge above and in sliding down it had probably capsized, throwing the deeper ore to the surface. This Seely ledge is the one I have mentioned as cropping up so prominently, running to the top of the mountain. When I passed through the district, in March, the company were running a tunnel from the gulch. I should say they will tap the ledge at a depth of five or six hundred feet. I do not know if they have yet reached the vein, but if they find ore such as that in the slide above mentioned (and I do not see why they won't) that will be one of the most valuable mines in the country. Of the *quantity* of ore to be obtained there can be no doubt whatever. At the extreme northern end of this range (and not far from the Seely ledge) is the "Shoshone Peak"—a very high, rugged promontory, perfectly barren of vegetation but supposed to be teeming with the precious metal. The Shoshone company located some very good ledges here, but through neglect of the company in not working them, they became forfeited and were re-located by other parties.

The character of the quartz in this district is generally the same—grayish or brownish at the surface but turning white at a little depth below, containing argentiferous galena, some black sulphuret of silver, but not much chlorides (and in this respect differing from the ledges in the granite formation) most of the surface rock being stained with blue and green carbonate of copper. A few sacks of ore from one of these veins, was taken and worked in a mill at Dayton, last winter, which yielded at the rate of $3,200 per ton. This is of course above the average, but nevertheless it is satisfactory to know that such ore can be obtained. There are several ledges of gypsum in the district, which are rich in silver. In connection with each is a stratum of antimony.

The formation of the Toiyabe range is principally slate, with occasional strata of porphyry and gneiss. The general course of the ledges is some 20° to the west of north and east of south, and the dip about 70° to the east.

There are several mills in process of erection on the creek—both for steam and water power. All are sanguine of good results and sure of the profitable working of the ore. The cañon is broad and has a natural grade to the divide to which there is an excellent wagon road. A company now have a franchise to grade a road over the divide into Smoky Valley. When this is done, Big Creek Cañon will be the natural highway for the overland travel.

A.

Attention Secretaries! — The new advertising law requires mining notices appearing in the county in which the works are situated, to be published Saturdays, if a paper is published there on that day. Consequently advertisements answering the requisitions of the new law by publication in the Mining and Scientific Press, will be correct for insertion in the paper nearest the mine, in most cases. We append the section requiring the above provision, which we presume has been overlooked by some in making out their notices:

Section 6. * * * * * And also in some paper published in the County in which the works of the corporation are situated, if a paper be published therein; *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary; and *provided, also*, that if there is no paper regularly issued on Saturdays at any place where publication is required to be made, the notice may be published in every issue of the paper which is most frequently issued at such place, for the full period of four weeks.

The spirit of the new law seems throughout to be in favor of advertising all notices of assessments and sales on Saturday, and as most papers in the interior are issued on that day, the fact will prove a matter of convenience to secretaries.

The Aquila has been raised out of her bed in the mud, and came near taking French leave of her keepers, on Wednesday evening last. The force of the tide and a strong off shore wind caused her to part a portion of her fastenings, so that her bow, still submerged, however, swung off fully a hundred feet from the wharf, before the movement was checked. It is expected that the arrangements for raising her will be fully completed by Wednesday next. The fact that she has already been raised out of her mud bed, renders her eventual raising to the surface a mere matter of time.

[Written for the Mining and Scientific Press.]

THE FORMATION OF METALLIC VEINS.

NUMBER II.

BY EDWARD A. MILES.

Having considered the apparent construction of veiastone, the writer further proposes to treat of metallilerous impregnations, a branch of the phenomeua of metallic veins that is the most important one to those engaged in working mines, siuce a true fissure vein may be poor in metal at one point and rich at another, besides carrying ores of widely different values. The subject is one worthy of examination in a multiplicity of lights, with regard to the many peculiarities of the useful metals, singly and collectively, as they appear in naturo and when manipulated by art. Though possessing the intricacies of a volume, it shall be herein followed under the direct constraint of the general purpose of the theme.

Of some sixty-six known solid and gaseous, simple or undivisable elements of the earth's construction, but thirteen are non metallic; the balance, when retained separately in a solid state, having a brilliancy of lustre, and, in different degrees, all the other metallic properties of ductility, density, etc. Thus if the earth is of the same composition throughout its entire bulk, and there he conceived a banishment of the gaseous from combination with the naturally solid matter, there will remain a globe two-thirds less in weight, composed equally of metallic and non-metallic elements. Of the latter, all but about one-twentieth part will be silicon, the base of quartz, and all but a still less fraction of the former, the alkaline metals, potassium, sodium, calcium and magnesium, the earthly metal aluminium, and the useful metal iron. The alkaline and earthly metals, as well as the non-metallic silicon, from their overruling disposition to unite with the oxygen of the earth and atmosphere, rarely long retain any other than an oxide, rust-like or earthy form, in which state they play important parts in the chemical and organic changes of matter in the animal and vegetable kingdoms, aside from their mutual affinities and antagonisms among minerals. Many of the other metals have been only obtained in minute quantities from rare minerals, of which they form small constituent portions, and whose catalogue may still be considered incomplete. Others, again, have their particular zones of existence or connection with certain ores; thus platiuum, itself a rare ore, is always associated with very small quantities of four distinct metals, having marked characteristics, but more nearly resembling it, in most respects, than any other elements, and not often found elsewhere. It is very seldom that any metal is found in nature apart from others.

By the wedding of the simple elements, which in their new conditions seek further alliauces in an arithmetical progression of compounds, are erected all earthly forms. Perhaps few, among the generality of men, clearly surmise the almost infinite number of atoms comprising the interfilling of the structures modeled within the scopes of their visions. Nor do they often consider the variety of creations existing under the apparent singleness of hardness, color, lustre and other properties.

Gradually new discoveries are extending the clear insight of men of science to the material appreciation of realms where the mists of uncertainty once prevailed. In this respect, an important addition to science is the recent invention of an instrument, called Bunsen & Kirchhoff's Spectroscope, whereby the incandescent or glowing vapors of the simple elements of nature, whether existing alone or in combinations, are analyzed or detected. The magnified, prismatic image of the flame of each element is cast upon a screen, where it displays fixed bands of colors and darkness distinctly characteristic in size, number, shade and position. By the present power of this instrument it is possible to discover a concealed particle of matter the three hundred-thousandth part of a grain in weight; and yet, it must he far from the ultimate penetration of atomic division. It has not only exposed the universal mingling of certain elements, as soda, etc., with most of the fractional structures of nature, the great abundance in the earth of elements, such as the metal lithium, hitherto considered rare, the peopling of the atmosphere of this sphere, and, perhaps, the sun, with a great variety of minute elementary atoms, but has also revealed the miniature existence of *four new alkaline metals*, that although since accumulated in appreciable quantities, might, otherwise, have long remained unknown. This branch of science is yet in its infancy, and may ere long directly unveil to us the marvelous fact that infinitessimal atoms of most of the simple elements are extensively mingled in the various coarser combinations of the earth. With perfection in the instrument, may come the revelation of elements not now concentrated enough for its present discernment, and of the association of those metals now only detected in veins or their debris, with certain earths throughout the great mass of the globe. The writer cannot but believe that there is a circumstantial train of facts, almost amounting to downright proof, when considered in all their relations, of the wide and atomic distribution of all the useful metals in the earth.

Several years ago, Prof. Faraday experimentally proved the presence of silver in sea water by dissolving in nitric acid the rotten sheathing of a vessel that had been cruising for seven years in the Pacific ocean. The solution yielded silver at the rate of thirteen ounces, Troy, to the ton of copper, an amount that if originally present would have paid a profit for extracting. Succeeding experiments with pieces of the same kind of metal, before and after exposure to the action of sea water, demonstrated an eight-fold gain of silver in three years. This accumulation of the more noble metal was undoubtedly brought about by galvanic power, which is always exercised when two separate metals are in contact in saline solution. Copper excessively saturates the waters of the coasts of California and England, and is said to give speciality of color to other portions of the ocean. Iron, from its great abundance, is readily recognized as present in every body of water on the face of the globe. The otherwise undetected existence of silver in sea water, gives strong grounds of belief in its presence in the sedimentary strata of the earth, all up to the tertiary period, except those of the wealden and a few of the carboniferous epochs, having had birth in briny depths. It is true that the washings from existing ledges carry to the sea more or less metallic particles, and that other veins are, most likely, laved by deep waters, yet, as continual deposits must be expected, and, according to the igneous theory, many veins were formed at an early geological period, there should be, at any rate, a metallic deposition in the later series of stratified rocks. In connection with numerous other facts to be mentioned, the immense aqueous solution of metals in the waters of the ocean affords strong presumption of the same operation ever since the inauguration of sedimentary rocks.

It would appear from a comparative analysis of the present sea water, which, in addition to sodium and potassium, contains lime and magnesia, and the regularity of stratification in the older sedimentary rocks, that they did not entirely progress outward from the land through the simple depositing of material from disgorging streams, but that the various particles of primary, or earliest formed, rocks of the universe were chemically revolved into their simple elements by the dissolving properties of sea water, and afterwards precipitated; certain conditions inciting the deposit of lime as limestone, and changeful causes that of silica as sandstone, alumnia as clay, and magnesia with lime as magnesian limestone. Probably the heating of the waters of the ocean by subaqueous eruptions had much to do with the dissolution and after precipitation of stratified material. The primeval oceans must have been more highly saturated with corroding elements than those of the present day. It would be difficult to state the precise changes wrought with calcium, for instance, but it is extracted from sea water as a chloride and sulphide, and in its final position in sedimentary deposit is a carbonate of lime. It is believed by some scientific observers, that all the atoms thus compounded with the organic element, carbon, necessarily had to undergo the transition of forming a part of animal life, having their restoration to inorganic nature in the empty tenements of the innumerable hosts of invertebrate animals that have successively left the ruins of their architecture in the sealed foundations of the earth's surface. In some limestone strata visible fossil remains form almost the entire rock, and communted earth, brought up from the present beds of the ocean, on microscopic examination, shows each particle to have been the crustaceous domicil of minute life. The disposition of fleshy organism to reduce metals from solution is well known; and metals could hardly have impregnated the waters of the primeval oceans without being subject to deposition from this cause. The sedimentary strata richest in metallic veins are naturally highly fossiliferous; and it is extremely doubtful if metals of any kind separately existed in veins until after the advent of organic life. The idea may be thought fanciful in regard to organic aid in the sedimentary concentration of metals; nevertheless it may be a beautiful principal in the animal economy, that infinitessimal deposits of gold, silver and other metals are due to the vital processes of living laboratories in the ocean depths.

Chemically, only chlorine, the predominent infused element of sea water, has any direct action on pure gold, with which it forms a terchloride. By the assistance of heat, gold in this form readily unites with magnesia and potash. Silver is easily altered into a chloride, which will form compounds with chlorides of potassium, sodium and calcium, decomposable by carbon, and even water. Sulphur, another element of sea water, has a corresponding action with chlorine upon most metals. These chemical operations of the laboratory show that there is no absolute bar to the union of the useful metals with those of an earthly form. It would be difficult to affirm the precise action in Neptunian solutions, which hold other elements dissolved; but it will be seen that powerful agents of mutual decomposition and reconstruction are present in sea water, although their ways are many and secret.

There seems to be a certain connection between minuteness of division in elements and oxidation, or a similar league with chlorine, sulphur, etc. The equivalent weights of the chief metals existing as earths are the lowest in the scale of solids, and iron and zinc, the most oxidizable of the useful metals, stand but little above them. Every metal acquires a greater or less film of oxidation, and in proportion as those metals of high equivalent weights are subdivided, the more free is the union with oxygen, chlorine and sulphur, the powers of their affinities being apparently in regard to surface presented and the inverse ratio of weight.

In its lowest atomic division, gold may be strongly disposed to unite with oxygen and chlorine; with greater concentration this disposition might be weakened until entirely overruled. The result of the sedimentary deposition of metals would be to separate them from a large quantity of matter and cause them to occupy a smaller zone of affinitive elements. In the case of gold, the first concentration of this kind might remove it beyond the arbitrary influence of any but strong chemical powers. Supporting this conclusion is the established fact that when gold veins are found in metamorphosed rocks, distant from any erupted dykes, that the formation is traceable to the oldest fossiliferous system, the lower silurian.

PACIFIC RAILROAD.—The Aurora *Times* has some sensible remarks in connection with the importance of an early completion of the Pacific Railroad over the mountains:—

Every mile of railroad completed on the route tends to lower the price of freight, an item in which the people of this State are largely interested. The Central Pacific Railroad has done remarkably well since they commenced the work, and would progress better were it not for the jealousy and local prejudices of parties who, because every particular does not suit their views, or promise to put money in their pockets, are disposed to throw obstacles and hindrances in the pathway of the company. What need Nevada care who constructs the road? Her inhabitants are affected by delay, but not by the profits that may arise from the work as reward of the enterprise that constructs it. That company which gives assurances of the earliest completion of such a communication is the one to which her encouragement should be given. A work of such vast importance should not be checked, hindered or delayed because its course or particular locality may not suit the individual interest, and directly enhance the property of certain parties in different localities. The road is the object.

CORPORATIONS.—The following "Act concerning corporations" was passed by the fifteenth Legislature:

SECTION 1. All associations or companies heretofore organized and acting in the form and manner of corporations, and that have filed certificates for the purpose of being incorporated, but whose certificates are in some manner defective, or have been improperly acknowledged, or have been acknowledged before a person not authorized by law to take such acknowledgements, are hereby declared to be and to have been corporations from the date of the filing of such certificates, in the same manner and to the same effect and intent as if such certificate were without fault and properly acknowledged before the proper officer, and all such certificates are hereby validated and declared to be legal, and shall have the same force and effect as if such certificates were free from all fault or defect, and were properly acknowledged before an officer having authority to take such acknowledgements.

SECTION 2. This Act shall take effect immediately. Approved April 1, 1864.

THE BARTOLA PROCESS.

Our Colorado neighbors in the Pike's Peak region appear to be doing much in the way of experimenting, to determine the most approved processes for working gold ores, more particularly auriferous sulphurets, which appear to constitute a very large, if not the largest portion, of the entire material of their gold-producing veins. Experience has proved that the ordinary processes for working gold ores, employed in California, is entirely inapplicable to a large portion of the ores of that region. Very little gold is found free, or mechanically mixed, with quartz; as where the ordinary mill process gives but twenty, thirty, or fifty dollars result, the assays from tailings prove an actual loss of three, four, or five times that amount. This loss is found to be in the sulphurets. A similar loss, but at a much less rate of percentage, is found in working the gold mines of California.

Experiments have been in progress for the past year or more, in two distinct lines, to avoid this ruinous loss. Of course the decomposition of the sulphurets and expulsion of the sulphur, has been the point to be gained. Dr. Keith, to whose process frequent allusion has been made in the columns of this paper, has been experimenting for some cheap and effectual method of desulphurizing by the aid of heat. The great cost of "plant" (furnaces, etc.,) and the large expense attendant upon the manipulation of the ores where reverberatory furnaces are used, has induced the Dr. to endeavor to seek out some cheaper method. The result of his experiments has been the production of a kind of reverberatory furnace, of cheap construction, *without a hearth;* the ores being desulphurized while passing through the flume of the furnace in a current of air, without any manipulation whatever. This process, it is claimed, works quite satisfactory.

In the meantime another party has been operating in another manner, which is termed the "Bartola Process," and which is essentially *chemical* in its nature, requiring no roasting operation. This process was thus spoken of in the Colorado *Mining Journal*, of Dec. 26th, 1863, as at work in the mill of Messrs. Kenyon & Shaffer, on North Clear creek:

They are working upon tailings, using the Bartola process for separating the gold. This consists of two operations. First a chemical one, and afterwards a mechanical treatment of the ores, whereby they are reduced, and the gold is liberated and amalgamated. To treat ores by this process they must first be crushed or reduced in the ordinary mill, or by some other method to an extent usually accomplished in stamp mills. The ores thus prepared are mixed with certain chemicals, of which we are entirely ignorant, and then placed in a steam vat, into which the steam is admitted from the bottom in such a way as to permeate and pass through the entire mass. Through the combined influence of the chemicals employed and the steam, a decomposition takes place, resulting in freeing the ores from a portion of the sulphur, or in neutralizing it so as to aid in the further reduction of the ores. This is the only secret which is connected with the process; the rest is open and patent to every one.

It appears to work on the same principle as that which operates in mixing silver ores with salt, and then leaving them for several months for spontaneous decomposition to ensue, as is practiced by the Mexicans, and as has been in vogue for centuries. The steam we presume is designed *to hasten this decomposition.*

After undergoing the chemical operation, the ore is placed in a somewhat peculiar arastra, known as the Bartola pan, for further reduction and amalgamating.

The pan portion of the process appears to be the same as that generally employed in working silver ores in this State and Nevada Territory. The following paragraph, in connection with this process appears in another number of the same paper quoted above:

The ores designed for treatment are received at the side door of the mill, in a room of 200 tons capacity. Thence they are introduced into the laboratory, where they are, by the aid of steam, subjected to a chemical treatment, of which Mr. Kenyon probably knows more than we. Its general effect, however, is at *a trifling expense*, the same as that produced by the action of the atmosphere. All mill men have remarked that ores, by being exposed to the weather, undergo a change which frees the gold, increasing their product from 25 to 50 per cent., according to the length of the slacking process. The secret of the treatment under consideration consists in neutralizing, by the use of chemicals, all poisonous substances in the ores, and transforming the sulphur from an antagonist to an assistant. * * * So far as this thing—process and mill—are concerned, it is quite the general impression that it has only to go to work and do well. As we understand it, numerous experiments have already demonstrated its correctness and feasibility. It is claimed that it will save 90 per cent. of the gold actually in the rock. If so, a new era is about to dawn on us. Assays from different mines on various lodes in almost every mining district in the Territory give from $100 to $300, and even $500 per ton. * * * We trust we shall be able to chronicle, inside of a month, the success of the Bartola process and mill—the establishment of the Kenyon Mining Company being now prepared to commence operations. In the event of the success of their present enterprise, Messrs. Kenyon & Shaffer will establish similar works upon extensive mining property owned by them in Clear Creek county, during the coming Spring.

The last extracts were published on the 6th of January last. We have now before us a copy of the same paper, dated April 7th—three months later—from which we extract the following:

THE BARTOLA PROCESS A SUCCESS.

To satisfy the friends of this Process, we would state that all experiments thus far have resulted satisfactorily. Messrs. Cook & Kimhall have their fine new mill put in partial operation, and they are so well pleased that they have already ordered the machinery, not only to double its capacity, but to build one, if not two, similar establishments in Clear Creek county—one above and the other below the mouth of Fall river. They have commenced work there, with this end in view. They have now four Chilian mills and twelve pairs of pans in operation, and inside of two weeks will increase the number of the former to six, and that of the latter to thirty. To give a complete idea of their treatment, a Blake's Crusher will first be brought into requisition, then stemps, then the Chilian mills, then the chemical treatment known as the Bartola Process, and, finally, the amalgamators—the latter running till nothing is left in them but amalgam and water. The capacity of the Chilian mills is five times as great as that of the amalgamators—the latter using, including stoppages, 75 lbs. of material each per hour, equal to the consumption, in a mill of 30 pans, of 27 tons tons of ore per 24 hours. Our readers can continue the calculation at their leisure. * * * We have obtained our information directly from them, but it was rather against than in consonance with their feelings. They have no interest in the Bartola Process, further than that they can make use of it.

It appears that Mr. Bartola has had large experience in mining, both in Europe and this country, and has been at work for some six years in New York in bringing his invention to what he considers a satisfactory degree of perfection. We give the above as we find it in the Colorado *Mining Journal.* We have been watching the progress of the above experiment with no little interest for some months past, and hope soon to be able to give something further in relation to the matter, through direct correspondence from Colorado.

If the process is found to work well for gold, it ought certainly to be far more readily applicable to the working of sulphurets of silver, which, as a general thing, and especially as found in Washoe, are much more yielding than auriferous sulphurets. We hope soon to be particularly informed upon that point. Whatever information is gained will be as freely given as received.

From $25,000 to $30,000 worth of bullion is daily shipped from Virginia City by Wells, Fargo & Co.'s Express. The weight of this freight averages from a half to three-quarters of a ton each day.

The Red Bluff *Independent* says that persons inclined to work can find plenty of it at Copper City. In addition to the labor carried on in the mines, a number of roads are in course of construction.

[Written for the Mining and Scientific Press.]

Letter From Austin.

Messrs. Editors:—I have delayed writing to your valuable journal for some time, for the reason that I had nothing encouraging to say of our prospects; but as things have materially changed for the better, I think I can impart a better feeling to all particularly interested, and to the mining interest generally. It is now pretty generally conceded that mines must be developed before they can become marketable, either at home or abroad; and with this improvement in the sentiment of the miners and capitalists, we find our only salvation, and while the "wild cat" is being rejected and thrown entirely by the board, our promising claims are being developed, and the best interests of the country most speedily established.

The truly rich working results of the North Star ledge have given an impetus to our mining interests that cannot but prove of the highest consideration. I do not question for a moment but that there are hundreds of claims equally as rich, and it would be strange indeed if the ledge most developed should prove the only paying institution in this district. In connection with the North Star, Southern Light, Oregon and Blue Ledge Consolidated, they have a ten-stamp mill of the first-class, all of which is embodied in what they call the Oregon Mill Company, consisting of but five members. There has been none of the stock in the market, but it is generally understood here that a sale of fifty feet was made recently for the sum of $54,000.

The first northern extension, as well as the first southern, of the North Star ledge, I was informed, were segregated from the original, and, of course, constitute a part or parts of the same ledge. The north extension was, I believe, incorporated in San Francisco, and is now being worked under the superintendence of Mr. D. Buel, the Democratic candidate for Mayor of Austin. The south extension is owned by three men, and unincorporated. Work is being done on both ledges, or rather by both companies. The Gov. Seymour, I think, will prove to be on the same ledge, as it stands on a line of the ledge and shows the same quality of mineral so far as opened. It is probably 1,000 feet northerly. The Savage is in front, westerly, but a few hundred feet further down the incline, and the Oregon, Isabella and Manhattan as many feet above, on a parallel ledge—all of the first class. The Maggie, in Yankee Blade district, is turning out good rock, and commands considerable attention. The company has worked their mine through good and evil report, and now are being rewarded for their perseverance and labor.

The most prominent mines in Amador district are being developed as fast as possible, and command fair prices in the market. The Rough & Ready, next to the Amador, seems to take the lead. The Coral is progressing finely. Their lead, after a little coquetting, has returned to the light, with a more radiant face than ever. A faint heart never won a fair mine, any more than it ever won a fair lady.

The mills are spasmodic in their efforts. Sometimes all in concert at work, giving hope and consolation, and again shut up, like the temple of Janus, for the want of something to crush. That we have rich mineral no one denies; but why the work at the mills is so unsatisfactory, don't seem to enlighten the impatient miner, who seeks the wand of Aladdin, rather than the slow and toilsome wealth hidden in the bowels of the earth. A more healthy state of things is being inaugurated in our midst, and Reese River will no longer be looked upon with cupidity and distrust. B.

Austin, N. T., April 25th, 1864.

A Huge Bird, said to be a pelican, was recently killed near Carson City, N. T. The feathered monster attracted considerable attention. The bird measured from the tip of one wing square across the back to the tip of the other, eight feet; from the point of his bill to the tip of his toes, fourteen feet.

California Exports.—California is now shipping largely of grain, flour, and many articles of produce to China. We have two regular lines to that country—one by Messrs. Macondray & Co. and one by Messrs. Koopmanschap & Co., and the trade is rapidly increasing, and California is reaping the benefit thereof.

WASHOE STOCK MARKET.

Review of the Week Ending May 3d, 1864.

The week ending with our present review has been rather dull, the sales having been unnsually small.

We quote Ashland at $3. One hundred and twenty shares Alban sold from $14@16; Arizona, ten at $8.

Badjazette and Golden Era has sold at $25; Baton Rogue, at $2½.

Ten shares of Colorado sold at $5; twenty-eight of Consolidated Brotherhood, at 50c.; ten of Combined Effort at $6.

Daniel Webster has sold at $25; De Wit Clinton at $2.

Effingham still continues to fluctuate. Ten shares sold on Thursday at $4, and fifteen on Friday at $1. Its fluctuations last week were from 75c. to $4. It may be called, decidedly, a fluctuating stock.

Ten shares Front Gold Hill sold at $7; Free and Easy has been considerably enqnired for—we notice five transactions, embracing 200 shares at from $4 to $6, closing at the latter figure.

One hundred shares of Green have sold from $4¾@5½ Gray & Cook is qnite a stranger at the board, but has been heard from at $80; Gilmorc has found a pnrchaser at $2.

Harold & Argo has been considerahly enquired after. Opening on Wednesday last at $6¾, it dropped to $4 at the opening of the board on Saturday, subscquently advanced to $8, touched $9 on Monday morning, but gradually dropped to $6½, at which figure it closed; 183 shares ebanged hands between the above figures.

Jewett & Shephard still coutinues to form the chief feature of tbc market, fluctuating from $26@45, and all intermediate figures. Thc closing sales were at $34½. We notice salcs of 555 shares, embracing a large number of transactions.

Forty-five sharcs of Judge Advocate changed hands at $50.

Knickerbocker has bcen more enquired after within the last few dnys. We quote sales of 110 shares at from $30@35, closing at $32½. Kossuth has been dealt in to some extent at from $10¼@13, closing at $11. King Solomon has not heen heard from the past week.

Legal Tender has heen some sought after at improved rates. We note sales of sixty shares at from $17½@19, closing at the latter figure, with an upward tendency. Leopold has sold for $7½; La Mina del Alto at $2.

We quote Mother Lumpkins at $2; Milton has been heard from at $26.

New Oregon has found buyers from $15½@16.

Orleans Flat has met with a single purchaser, at $15.

Sales.—Five feet Mountain Queen at 4.50. Five feet same ledge at 8.

The British Columbia Mines.—A recent correspondent of a city cotemporary writes as follows from Victoria with regard to the Columbia mines:—

More people have left Victoria this year than last for the gold mines of British Columbia, and a general impression prevails that a large crowd will be shortly assembled there, swelled, as there is a great probability it may be, by a considerable numher of "overlanders" from Oregon and Washington, or, rather Idaho Territories. There is nothing very startling from the mines—no great inducement; but a steady, unwavering confidenee in the greatuess of that country as a gold-bearing region, exists. Its progress is steady; it has taken its place, and nothing will prevent its future prosperity, although it will, nndoubtedly, be subject to the variations incident to all mining countries. It is more important to the future welfare of the country that its agricul tural resources should be brought into play; and this is now being done, for farmers and farms are increasing in number, size and extent, and this source of wealth, which used to be despised, is now becoming more attractive as it will be more lasting. British Columbia is all right for the present, at all events, and every year will add to the experience of those who may choose to settle within her borders

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

THE Gold Hill *News* says that a large party of well known citizens of Virginia will shortly start for the famous Jordan creek mines, near Boise. They go with Jordan himself, the man after whom the mines are named.

TREASURE SHIPMENTS.—The total amount of treasure shipments from this port, since the first of January last, have been $21,893,228
Corresponding period last year..... 15,892,103

Excess this year $6,001,124

Mechanical Department.

Home Industry.

We have already, we claim, fulfilled our promise to make this paper a faithful and reliablo expositor of the material wealth and progress of the Paeific Coast. To rendcr it thus worthy the great intercsts it represents, we have spared, so far, neither expense nor labor; and in our enlarged condition will be found every week as copious and completc an account of mining intelligence of every description, and from every section of the country, as it is profitable, to the reader, to collate.

In its second capacity, as a mechanical and scientific organ, we intend it to be equally complete. Our pages have always been freely opened to the illustration of local inventions, or improvements in machinery, both agricultural and mining, and to the publication of scientific progress. Through our large circulation, all interested, by being made familiar with, may have the advantage of the collective mechanical and inventive genius of the State. Up to this time, however, we have not had it in our power to render this department as complete as dcsirablc, but we now propose to supply the defieieney.

Few persons, even residing in San Francisco, whose pursuits, or habits of observation, do not bring them in contact therewith, have anything like a correct estimato of the extent and cbaraeter of the different mannfactories of this city. Wc propose, therefore, to commence next week a series of articles, to appear permanently and regularly, on all tbe branches of mcchanical art in the city, giving a conciso history of each until we have exhausted the subject. By this means we hope to gather and distribute much important matter, relating to the progressive history of the State, and mako our paper, what we desire it to be, a valuable and desirable weekly visitor to every household, counting-room aud shop in the State. A gentleman, known favorably as a writer in our pages has been selected for this duty, and we feel assured, our friends and patrons will gladly afford him, when he calls upon them, such information as may be necessary, to make our efforts in this respect, successful aud satisfactory.

What is Heat Lightning?—The flashes of lightning, often observed on a summer evening, unaccompanied by thunder, and popularly known as "heat lightning," are merely the light from diseharges of electricity from an ordinary thunder cloud beneath the horizon of the observer, reflected from clouds, or perhaps from the air itself, as in the case of twilight. Professor Henry says that Mr. Brooks, one of the directors of the telegraph line between Pittsburg and Philadelphia, on one occasion, to satisfy himself on this point, asked for information from a distant operator during the appearance of flashes of this kind in the distant horizon, and learned that they proeeeded from a thunder storm then raging two hundred and fifty miles eastward of his place of observation.

Screwing on Nuts.—Wc have sometimes known nuts to be found so tight that no wrench would remove them. This was beeause they had been held in the hand till they beeame warm, and being then applied to very cold screws in winter, they contracted by cooling on, and thus held the screw with an immovable grasp. Always avoid putting a warm nut on a cold screw; and to remove it, apply a large heated iron to contaet with the nut, so as to heat and expand it, and it will loosen at onee—or a cloth wet with boiling water will aceomplish the same purpose.

In proving some 68-pounders, lately received at Woolwich from the Lowmoor Iron Contraet Works, one of the guns gave way at the breech, and was shattered to pieces—a very unusual circumstance. It was discovered that a bar of wrought iron, weighing eight or ten ponnds, had fallen into the casting machine, as the bar was found imbedded in one of the fragments.

Barrels without Hoops.—A workman in Paris has succeeded, it is said, in making barrels without hoops as solid as the best hooped barrels in the world. The diseovery, which has been a desideratum for some three thousand years, is now undergoing examiuatiou before the Academy of La Rochelle.

[Written for the Mining and Scientific Press.]

"Latent Heat" Compatible with Thermodynamics.

BY J. H. CHURCHILL, A. M.

"Latent heat!"—a force in any one of its forms may still exist, althougb latent. To Dr. Black we are indebted for tho first application of the term. Tho force is concealed from our senses, as heat, is its literal meaniag. He thus defined it in his lectures when James Watt studied among his pupils in Glasgow, just a hundred years ago. Cautious, as a true man of science, to admit nothing beyond the present span of his experience, his definition tallies to-day with tbe increased growth of knowledge. Dr. Robison, another of his pupils and his successor, thus reports him: "Many have been the speculations and views by ingenious men about this union of bodies with heat. A nice adaptation of conditions will make almost any hypothesis agree with the phenomena. I therefore avoid such speculation as taking up time which may be better employed in learning more of the general laws of chemical operations. I content myself with saying, that in liquefaction and vaporization, water absorbs a great quantity of heat, because this expression immediately raises the notion of a sudden and somewhat copious accumulation of heat; and I say that this great quantity of accumulated beat is latent in the water or vapor, merely because tho thermometer, our usual tost, does not give us any indication of its presence—of which presence we are not allowed to doubt when we see the same quantity emerge again in its usual thermometrical activity when the water freezes or the vapor collapses. Without saying that I have any clear conception of the union between bodies and heat, I am well entitled by the phenomena to say that this vaporous combination differs in some peculiar manner from that which merely produces expansion"—i. e. expansion or extension of the fluid in the thermometer without any other change.

"We have learned that when ice molts, or when water boils, the cause of the phenomenon is the same with that of the expansion, because we observe that what produces a double or triple expansion also produces a double or triple liquefaction or vaporization, and that congelation and condensation accompany contraction, which is always produced by the abstraction of what was the cause of expansion"—i. e. as in the thermometer. "But we see reason to think that the manner in which the general cause of these phenomena acts in producing its effects is somehow different."

The difference thus noted by Black is determined by the laws of thermodynamics and the correlation of forces to be due to a conversion of force, in the form of heat, into force in the forms of modified physical and chemical properties.

Towards the close of the century, Dr. Thomas Young discovered the mode of interference of different waves. Hence has grown up the mathematical theory of undulations which explains so completely the various phenomena which are common to the different forms of force, whether developed as light, or heat, or sound, or electricity, etc., etc., as to have obtained almost universal credence. pari passu with the more clearly demonstrable doctrine of the convertibility of each of the forms of force into another in definite proportions. The following phenomenon will have come under the notice of most. When a stone is cast into a pool of water, circular waves start off from the point where it struck. These waves consist in a succession of ridges, separated from each other by hollows. Suppose two stones thrown in a little apart, the waves starting off from one center will cross those starting from the other. Three cases will now occur—one ridge will cross another ridge, one hollow will cross another hollow, or one ridge will cross a hollow. In the first two cases the forces of the descending stones, which have assumed the visible shape of waves, will concur. They will unite in raising the water in one case and in lowering it in the other. The ridge will be higher, the hollow lower; but where ridge meets hollow—where one wave "interferes" with the other—there the one neutralizes its own amount of force in the other, and if the original forces were equal, the result is an undisturbed spot among these sets of waves—one balances the other. These two mechanical forces are now latent—unseen. One sound may equally be made to overcome another—the two result in silence. One wave of light has been made to extinguish another—darkness the common end. This is the basis of that wonderful instrument of modern science, spectrum analysis. But a much more interesting result to those who are charmed with the beauty of a natural phenomenon, occurs when light is made to meet the thin film of a soap bubble. Part of it is then reflected from each surface of the film, just as a stage ghost is reflected from the polished surface of plate glass; but in the soap bubble the thickness varies. Here the light reflected from the inner surface coincides with and intensifies the red ray; there where the film is thinner it coincides with and intensifies the blue ray, and so of others, while those lost to view are neutralized. An illustration perhaps better known to Californians will impress this idea. Peacock ore owes its beautiful tints to the varied thickness of the film of oxide on its surface. The writer recently found several instances of such tints on some waste tin that had been weather worn on our sandhills. We owe it to chemistry that we know that matter is indestructible. We are indebted to the science of heat for the recognition of the fact that force ever changing its form is no less immutable in quantity.

Treating Mineral Oils.—Mr. Louis Martin, of Paris, proposes that, after the oils or hydro carbons have been treated with sulphuric acid and soda, to mix them with from 1 to 10 per cent. of a mixture composed of 1 part bichromato of potash and 2 parts caustic soda, at 36°, and distil. Any salt of chromium may be used, and any alkali may be substituted for soda, The oils are then distilled with sulphuric acid and soda, as before.

Advantage of Railways.—A single generation since, the town of Middlesborough-on-the-Tees, in England, consisted of but one house. A railway, making it a port for the coal shipping trade, had raised its population to 7,893 at the census of 1851; then came the discovery of the value of the iron-stone in the neighborhood, and the result is that the population now exceeds 23,000.

Preventing Incrustation of Steam Boilers.—Mr. John Travis, of Royston, Lancashire, proposes the use of Irish moss, or silicate, arseniate, or phosphate of soda, to prevent incrustation of steam boilers. From 6 lbs. to 8 lbs. per week usually suffices for a 40 or 50 horse-power boiler.

F. S. Barff, Dublin, for preserving and hardening brick, stone and other surfaces, and timber, proposes to use soluble silicate of soda or of potash, by preference the silicate of potash, with a mixture of sulphate of barytes and carbonate of lime. The mixture is laid on with a brush.

Masses of platinum, weighing 53 ounces, are frequently smelted in 13 minutes by the oxhydrogen blow-pipe, by Dr. Roberts, dentist, New York. So says the *Scientific American*.

The milk condensors have begun to condense cider by the same process as that by which lacteal fluid is converted into lactcal solid. It is reduced to one-seventh of its bulk, a beautiful amber-colored jelly. By the addition of six times its bulk of water, it becomes clear cider again.

Indian Wrongs.—Ross Brown, in one of his recently published letters, lays the blame of the present Indian hostilities in Arizona, upon the whites. He convicts an army officer of perfidy, in having, under pretense of friendship and to form a treaty, allured some forty Indians unarmed into his camp, and then set upon and slaughtered them without mercy. This and other similar outrages, so alarmed and incensed the savages that they have formed an alliance between many tribes, and are now waging a war of extermination against whites and Mexicans.

The United States has sold some 70,000 acres of land in Tulare county, says the *Delta*, and yet we have not 20,000 in cultivation. Besides, there are yet more than 200,000 acres of good agricultural land in the county; lands which in other States would be considered of the very best quality, and every forty acres of which would constitute a valuable homestead for some thrifty family.

Hit the Nail on the Head.—A new way to get higher wages was lately devised by the nail cutters in Dudley and East Worcestershire, England. They notified the owners of the mills that unless they received an advance of six cents per thousand, they intended to strike for twelve cents.

An Item from China.—Hongkong is to be blessed with a new coin, which will do away with the miserable substitutes for change so long current. The new coinage consists of dimes, cents and mills, in exact accordance with our currency. The mills are to take the place of the copper "cash," and have a hole drilled in them after the Chinese fashion for the purpose of stringing them.

Patent Department.

SOMETHING NEW IN THE SEWING MACHINE—*A California Invention.*—Perhaps no machine of modern invention has attracted more attention or come into more general use and knowledge than the Family Sewing Machine. It has already proved one of the greatest of boons to the domestic circle, relieving the housewife, daily, of many hours of toil and wearisome "stitch, stitch, stitch." Long and steady use of these machines, however, it is found is working a sad detriment to many of our mothers, sisters, and daughters, from the peculiar effort of the muscles required to keep them in motion; that effort having to be made in the worst possible position of the body—a sitting posture. This condition of things, it has for some time been feared, would drive the sewing machine, after all, from general use in the parlor and sitting room, to the shop, where work enough could be collected to make steam or some other motive power available.

Just at this point, however, one of our numerous California inventors, Mr. Jacob Zuckerman, of San Jose, comes in and supplies the very thing we need, in the way of a "Self Operating Sewing Machine," which requires no further effort on the part of the person tending it, than to guide the cloth in its movement under the needle. The machine is started and stopped by merely touching a knob, much like the stop of an organ, and it stops almost instantaneously, instead of continuing in motion for quite a number of stitches, as is the case with other machines. Another and important advantage derivable from this self operating principle, is the perfect regularity of motion obtained, instead of the irregular jerking motion inseparable from the treadle, and which is the great cause of the present machines in use getting out of order, breaking threads, needles, etc. It operates upon the principle of clock work.

The apparatus for running an entire day, can be wound up by a ten-year-old child, in five minutes. The inventor is now exhibiting one of these machines for a few days in a room in the Masonic Temple, on Post street. Every lady in the city should go and see it. We are quite confident that any one who once sees it will never think of buying any of the present make after these are in the market. The inventor already has quite a list of orders to be filled as soon as arrangements can be made for their manufacture.

NEW STEAM VALVE.—We saw a few days since a new balance steam valve which is being attached to an engine now in process of construction at the Pacific Foundry in this city. This valve is the invention of G. W. Bollen, a mechanic, employed in the finishing shop attached to that foundry. The invention claims to be an improvement, operating as a balance slide valve, and is so arranged between two cheeks, that the pressure on one side is almost perfectly balanced by that on the opposite side. The valves are furnished with a separate valve seat, by which the openings of the cheeks are adapted to the steam and exhaust passage of any ordinary cylinder. The principle of the operation of this valve, so far as the lap, lead, travel and expansion are concerned, is the same as that of the ordinary three ported valve; but instead of working under the pressure, and with the friction of the ordinary valve, it need work with no more than may be required to keep it tight. There is no unbalanced pressure downward, and the pressure upon the cheeks is sustained by the steady pins or bolts with which they are adjusted and secured. These valves may be readily applied to almost any cylinder in use. The invention was originally made in St. Louis, about the time of the breaking out of the war; but the inventor having soon thereafter occupied a position in the army little has been done toward introducing it up to the present time. We shall note with pleasure the progress of the present application.

MR. M. W. PEASE, of Davies county, Ky., has received a patent for a "Mode of Securing a Desirable Color to Tobacco." The inventor claims, in his specifications, the adaptation of an instrument for deadening the tobacco while growing in the field, by belting or cutting around the stalk, and piercing the same in or near the belt or cut, to secure a desirable color, lessen labor, etc.

GATHERING MECHANISM FOR SEWING MACHINES.—Henry S. Brown, of New York City, has secured a patent for the making of gathers by a sewing machine, by the micro action of the needle and thread. The gathers are thus made in a piece of cloth, and securely fastened by the stitching apparatus, while the feeding mechanism is arranged and operated accordingly.

NEW EXPLOSIVE COMPOUNDS.—During the week ending March 31, two different patents were issued at Washington for the manufacture of explosive compounds, designed to take the place of ordinary gunpowder.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

The Mining and Scientific Press Patent Agency.

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his pinns to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes a minority uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $30. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail.—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the status of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months...	$10
On every application for a design, for seven years...	15
On every application for a design, for fourteen years...	30
On every caveat...	10
On every application for a patent...	15
On issuing each original patent...	20
On filing a disclaimer...	10
On every application for a re-issue...	30
On every additional patent granted on a re-issue...	30
On every application for an extension...	50
On the granting of every extension...	50
On appeal to the Commissioner from Examiners-in-chief...	20
On every appeal to the Judges of Circuit Court, D. C...	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, and to advise as to the scope and validity of patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the applicant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

San Francisco:

Saturday Morning, May 7, 1864.

Our present issue consists of Twenty Pages. The reader should carefully stich or pin the sheet together hefore cutting the leaves.

Correspondence.—An article from "H.," Forhestowu, will appear soon. "From the Reese River Mines," by "X," in type for next week.

THE PROPOSED MINING TAX.

The telegraphic report of the proposition before Congress to levy a tax of five per cent. on the gross yield of the mines, is producing a most profonnd sensation throughout this State and the adjoining Territory. There is imminent danger of its final passage, unless prompt means are taken to place the matter in its true light before our National legislature. It is with this view, and to avoid so great a calamity, that the San Francisco Stock and Exchange Board have promptly taken the matter in hand, and before this meets the eye of the reader, will doubtless have forwarded to Washington, by telegraph, a carefully prepared memorial protesting against the policy of such a tax. No body of men on the Pacific coast can speak more authoratively, or with greater weight, in this matter, than this organization. Mr. Conness has also telegraphed to his friends in this State that he will do everything in his power to arrest the measure. The argument in this matter has been so often and so ably placed before the public, that it would he a useless repetition to re-prodnce it at this time. Our readers upon this side of the contiuent perfectly understand the merits of the question; and have the fullest comprehension of the consequences to result from the passage of the measure as proposed. Newspaper comments are now too late to effect results in Washington. The telegraph alone can, at the present time, render efficient aid; and it will doubtlsss he brought fully into requisition.

It has been a matter of the utmost difficulty for those thoroughly posted by residence and experience among our mines, to convey, by words spoken or written, anything like an intelligent comprehension of our mining intcrests to parties who have never visited this State. People at the East take notice of the continued and, at present, increasing flow of gold from San Francisco to New York, and they occasionally meet with a returned Californian who has secured a fortune in our mines. These are the salient points—all the halance of the picture is hidden in a deep shade, which they will not or cannot comprehend. It appears incomprehensible to the great multitude at the East why everyhody does not get rich in California, and each thinks tbat if he should come out he would certainly return with a fortuue. Nothing can convince the great masscs, but an actual trial, that not more than two or three in a hundred can win anything that can he called a prize.

So it is with our law-makers at Washington. It appears to he an almost impossible accomplishment to make our national representatives from other States comprehend, in a rational manner, the true relation of business and facts, in connection with our mining industry. And yet, without such a comprehension, how is it possible for them to construct laws which shall so lay the hurthens of taxation upon these interests that they shall fall upon all connected therewith in due proportion. Equality in taxation is a landmark which should never he lost sight of. Let us hope that our legislators will he wisc in time, and listen to the counsels of such men as are familiar with all the bearings of the question at issuc, and whose patriotism and nuselfishness with regard to the general burthens of taxation cannot he called in question. Of such is a majority of our delegation in Congress; and such are the men in our own midst, who, in the present crisis, are endeavoring to make their voices heard at Washington through the telegraph.

MINING SHARE MARKET.

The Stock Market has shown an increased activity the past week. Stocks have generally changed hands at declining rates. The pressure upon the money market for means to pay duties on bonded goods, and the anticipated tax of 5 per cent. on the gross yield of the mines, has contributed to the depression in the money market, and forced upon sale large quantities of stocks that would otherwise have lain quiet. The sales of the week have reached $649,951 against $820,626 last week.

Ophir has still further declined, from $1,428, our closing figures of last week, to $1,010 at last evening's board. No improvement can he expected in this stock until farther developments are made in the mine. Active explorations are now in progress to that end, which can scarcely fail to meet with early success.

Gould & Curry shares have also been compelled to yield to the universal pressure, and have dropped from about $4,500 to 3,875, at yesterday's board. A dividend of $125 per foot has been paid the past week. The receipts of bullion, for the past month, have been unusually large, proviug that this depression is from no fault of the mine.

Chollar has been in less request, during the week, at $350. It suddenly advauced to $400, before yesterday's board, in consequence of some favorable report with regard to the injunction against it hy the Potosi.

Daney has not been much sought after though freely offered at reduced rates. It closed the week on Saturday at $105, dropped to 84 on Tuesday last, and closed yesterday at $90.

Savage has been heard from at $2,200. A dividend of $50 per foot was made payable on Tuursday last.

Michigan found a purchaser on Thursday at $37½; Central American is quoted at from $17@18; Baltimore American quiet at from $50@52½; Kohler Brothers at 28; Rock Island at 39; Bullion 80@90.

North American has been in less requsst; it may he quoted firm at from $155@165.

Nevada, J. G. has been in light request at about last week's figues.

Burning Moscow is still comparatively quict; it may he quoted at from $90@95. Blue Ledge has materially improved, and may be quoted at $23.

North Potosi has met with a large husiness, ranging through the week from about $70@85, it suddenly advanced before last evening's board to 98, huyer 15 days; 1228 shares have changed hands.

Pride of the West has been freely offered, at gradually declining figures; commencing at $75, it gradually dropped to 47 before last evening's board. It is intimated that this company will declare a dividend of $5 per foot on their capital stock about the 10th of the present month

Lady Bryan has met with an increased business, at slightly decliuing rates. We notice sales of 3680 shares, at from $37@49, closing at 40, r. w.

Buckeye is quoted at from $14@16. The superintendent writes hopefully from the mine. Golden Age and Empire is quoted at $35; Californiia Tunnel at $20@25; Harmon at $24.

Seneca sold at $27, on Saturday, remaining quiet until Thursday, when it dropped to 19. Beaver is quoted at 29; Santa Rosa, 4½@7½; Sacramento & Meredith, 31.

We quote Williams & Kellinger $55: El Dorado 35; Mary Ann 95; Imperial 150; Golconda 55; Crockett 7½; Badjazette 25@28; Knickerbocker 27; Sweet Vengeance 20.

Real del Monte has been more freely offered at declining rates. Opening at $67@72, it gradual.y declined to 53 on Thursday, hut closed yesterday with a single transactiou of ten shares at 60. Shares to the number of 520 have changed hands against 384 last week.

Wide West has sold from $24@26, closing at the latter figure. Silver Hill was sold at 16; Coso at 5; Utah, 31.

The Little Dutchy of Schleswio, the possession of which just now is setting all Europe in commotion, embraces within its diminutive bordsrs the still lesser subdivision known as Angelu—the little corner from whence went forth that hardy and energetic colony whose decendants afterwards became famous as *Anglo-Saxons*, and from whom our own American nation has descended. It would seem that the descendants, even to the latest generation, have lost nothing of their original power or inclination to make themselves famous. The original stock were always a people distinct from even their most intimate and surrounding neighhors, and have continued so to the present day, through all the three centuries of their Danish subjection. This characteristic of exclusiveness will, in all probability, continue, even though they may now he compelled to submit again to the German sway.

The Geological Society of England have recently been successful in connecting more intimately the English system of rocks with that of Europe. The northwestern countics contain a red sandstone which has hitherto hcen assigned to the new red sandstone or trias formation. It is now proposed to classify it with the Permian series. It is closely conformable with the magnesian limestoue, and may form the upper limit of these, the highest of the primary or palœozoic rocks. The Permian series is marked by firs, fishes, amphihra, etc. In Westmoreland, Cumberland and Lancashire, they may he divided into three natural divisions, corresponding to those of Germany. The same fossil plants have been found in the silicious works of Westmoreland and the marl of Durham. Sir R. Murchison supports the readjustment.

Prof. Silliman on His Travels.—The Esmeralda *Times* says of this scientific gentlemau, who recently arrived at Aurora City, that he had just visited Bodie District for the purpose of examining the mines. We understand that the Professor was highly pleased, and formed a very favorable opinion of the mines. He was about to visit the mine of the Real del Monte Company. Professor Silliman is an eminent chemist, geologist and metallurgist, and his high reputation gives great weight to his opinions. He is a native of Connecticut, and was for some years attached to Yale College. We learn that it is the intention of Mr. S. to visit the famous Valley and Falls of Yo-Semite, California, after which he will return to Aurora, and make a thorough examination of the mines of that district.

The Mechanics' Fair.— We would call the attention of mechanics, and our readers generally, to the advertisement in another column, of the proposed Industrial Fair which is to commence on the 30th of August next. The objects and utility of the exhibition are therein clearly set forth, and the rules and regulations for the exhibition are given in full.

Bullion from Washoe.—Wells, Fargo & Co. shipped. from their office in Virginia city, during the week ending Saturday last, bullion to the amonnt of $160,106. The amount shipped during the month of April was a fractiou short of 14 tons, worth, hy assay, $857,086.

Mill for Silver Mountain.—Judge Curtis, on behalf of parties engaged in Silver Mountain, has contracted with a foundry in Sacramento for an eighteen-stamp mill and thirty-five horse-power engine.

The Nevada *Gazette* mentions the ending of a lawsnit hetween parties in that town which had been in progress for ten years. During that time the property in dispute has been wholly destroyed.

The Washoe.—This new river-steamer starts on her first trip to Sacramento, to-day, and returns tomorrow. The supervisors of Sacramento have leased 200 feet of the levee, hetween L and M streets, as a permanent landing place for this boat.

Mining Gossip.

EDITED BY.....FRANK WARDDELL.
FOR THE MINING AND SCIENTIFIC PRESS.

A Novel Incorporation. — The San Salvador Commercial and Agricultural Company filed their certificate of incorporation, in the County Clerk's office, on the 2nd instant. The objects of the said association, are to acquire lands in the State of San Salvador, and other Central American States, for the purpose of raising coffee, cotton, sugar, tobacco, indigo, and other products; the constructing of the works necessary for the manufacturing, curing, and preparing the same for market, the purchase, shipping and selling the products of the country and generally to make use of the said lands, and all other property that may be acquired, as shall be most advantageous. The capital stock is $500,000 divided in shares of $50 each. The Trustees are John McHenry, Caleb T. Fay, Allen J. Gladding, V. B. Post and J. Dardano.

About Brokers.—An old New York broker, who has been a stock dealer for forty years, states that he never before has seen people quite as crazy as they now are. It matters not how worthless certain fancy stocks may be, they are snatched up by the eager crowd, who scarcely stop to dicker about the price. People who can command a few hundred dollars in green backs, no longer "dabble" in real estate, but rush down to Hanover and William streets, and place it in the hands of the bankers as a margin!

In Other Hands.—A new association purchased on the 30th of last month, the lease, good will, fixtures, etc., of the Stock Exchange, more familiarly known to the public as the "Open Board," of this city. The new organization who have now its affairs under their control propose admitting only one hundred members, at an initiation fee of one hundred dollars each. The present officers are as follows: President, D. J. Oullahan; Secretary, M. G. Elmore; Treasurer, C. A. Crane.

Investment.—A company of gentlemen representing some N. Y. houses, have recently arrived here, who intend investing the sum of $250,000 in the Owens River country. They feel confident, from information in their possession, that they will be amply rewarded for the investment in this rich mineral locality.

Dividends.—The Savage company declared a dividend of $50 per foot, which was payable on the 5th inst. The Gould & Curry also declared a dividend of $125 per foot on the 5th inst.

Killed.—Mr. R. E. Bellinger was instantly killed while working at the bottom of the Table Mountain, Mining Company's shaft, Copperopolis, by a tub falling upon his head.

Water.—The mountain reservoirs of the Tuolumne County Water Co., are now all filled. This must be acceptable news to the miners in that section of the country.

Creditable.—The New York Board of Brokers, have very generously subscribed the sum of $7,000, towards obtaining recruits to fill up the ranks under the command of General Hancock.

Real Del Monte Election.—At the annual election of this company, held on the the 2nd inst., the following directors were chosen: B. J. Vanderwater, William Norris, R. E. Brewster, F. R. Baby, A. Gamble, E. Jones, J. Lyon, E. F. Mitchell, J. W. Braly.

La Favorita, Mexico. — This company have now on the way to this port, per schooner Union, twelve thousand pounds of concentrated copper ore, which they expect will assay at the least calculation 75 per cent. of copper. The last report from the superintendent is a very favorable one indeed.

Kohler Bros. Company.—This Company have on the way some fifty tons of ore from their Espinosinia mine.

Buckeye.—We have been allowed to read the last letter received from the superintendent of this mine, and he appears to be very sanguine of striking the main ledge soon.

Firemen's Fund Insurance Co. — The following gentlemen were elected, on the evening of the 2d inst., as officers for the ensuing year: S. H. Parker President; M. Lynch, Vice President; Charles R. Bond, Secretary.

Owensville.—This place is growing very rapidly. There are in the course of erection fifteen or twenty buildings; stone, adobe and frame buildings being the principal style.

Died Out.—The Board of Brokers, at Gold Hill, N. T., has died out, as the business in stocks would not warrant its continuance, and furthermore most of its members were members also of the Boards at Virginia, where most of the stocks are selling.

An Opinion Worth Having.—Professor Silliman, who is considered one of the most scientific geologists in the United States, gives as his opinion, after a thorough examination, so says an Aurora correspondent of the *American Flag*, that Esmeralda is one of the richest mineral districts on the globe. After such an opinion as that, we think our friends in Esmeralda can well afford to "put on airs."

The Shelton Silver Mining Co., Argentine District, Washoe, had 900 lbs of their rock worked recently in one of the mills there, which gave the handsome result of $123 24 per ton of 2,000 lb. The success of this mine, it is claimed, proves the fact of the extension of the Comstock lode through and beyond Virginia City, to the north-east.

Copper.—The contract for the erection of the smelting works at Genesse valley, says the Quincy *Union*, has been let, and work commenced upon them. In a few months it will be demonstated beyond doubt that the copper ledges in Plumas county are the best in the State.

Good specimens of coal continue to be exhibited from various localities in Nevada Territory. The *Enterprise* hopes that some of the many mines now being worked may prove of permanent value. Every day the hills are becoming more and more bare of timber, and soon the Sierra will be the only resort for fuel. This, without a railroad, will be discouragingly expensive. Let the coal miners persevere.

Interesting Suit.—Quite an interesting suit is to take place in a few days, at which time, so it is said upon examination, many strange proceedings will be brought to light. One of the parties in the affair is a well known broker in stocks, who failed a few months ago and who recently sent his wife to the States. It is thought by many that he shipped with her a considerable amount of money, that justly belongs to the parties who have commenced the suit, they having advanced him at various times large amounts of money. So far they have been very heavy losers.

Memorial.—The 1st Stock and Exchange Board of Brokers have caused to be drawn up for their approval and adoption, a memorial with regard to the proposed Federal Mining Tax, which reflects much credit on the writer, Mr. L. A. Garnett. It has been unanimously adopted by the Board, and ordered to be telegraphed to Washington as soon as practicable. The memorial, which we would like to publish if space would allow, sets forth a plain statement of the facts in the case, meets with the hearty approval of our citizens generally, and is a fair representative of the opinions of the entire mining community with regard to the great evil that would necessarily arise if the proposed outrageous tax upon the gross income of the mines should be levied.

The Condition.—At the annual meeting of the Real Del Monte Company, held on the evening of the 3d inst., among other matters brought before the meeting, after the election of officers, was the financial report of the secretary, Mr. Willard, respecting the condition of the company, from which we learn that the debt existing on the 5th of March was $271,000, and on the 2nd of May, one day previous to the meeting, the indebtedness was reduced to $189,443, the company in the meantime having paid on notes due by them the amount of $42,400, leaving $977 cash on hand. They have received within the same time, from assessment No. 9, $47,820. Also received,

March	19,	Bullion	$11,238
April	8,	"	31,395
"	18	"	15,109
"	22	"	12,319
"	30	"	12,453

Making a total for six weeks of.....$82,514

There is still due on Assesment No. 9, $40,180, which they expect will all be paid in by the 25th instant. The report seems to be rather more satisfactorily received by the stockholders than was at first anticipated. We cannot conceive why this stock should not be up again shortly to its old market rates, when we take into consideration the amount of bullion that is being constantly taken out, the speedy reduction of its indebtedness, and the favorable prospects of soon having it a good dividend paying mine.

Another New Mine.—Among the passengers who arrived here from Mexico on the 30th of April, per steamer John L. Stephens, was Mr. O. F. Gehrike. This gentleman left San Francisco some nine months since, having been sent out by a private company, comprising some of our leading and influential merchants, for the purpose of locating or purchasing a good mine. Mr. G., we are informed, has at last, after many attempts, been very successful in securing a valuable mine, located within sixty miles of Mazatlan, and known as the Praderas gold mine. The Company here intend to incorporate at once, and thus take immediate action in the thorough development of the mine. We have seen some of the rock, and if there is much of the same description to be obtained there is no reason to complain for the want of good paying ore. The facilities of transportation we learn are also very good. Taking all things into consideration, we think the prospects of the company are very flattering.

Lucky Boy.—A young man, apparently in his 25th year, was heard to say, a few days since, in a public saloon in this city, that he had cleared in his mining speculation, by a company located here and which he represented in Philadelphia, the sum of $400,000. We doubt not but our readers will remember the mining enterprise which is probably alluded to, and created such a furor in that city a few months ago, and which the San Francisco papers pronounced an unmitigated swindle. We deeply sympathise with our Philadelphia purchasers, knowing from all accounts that they must have been most beautifully duped. If our eastern friends would rely upon California papers or correspondents of known standing, they would avoid such swindles.

Cost of Working a Mine—The Gould & Curry Mining Company have taken out of their mine, during the past month over half a million of dollars, and the dividend declared was only $125 per share, and as there are 1,200 shares in the mine it will show that the entire amount which the stockholders received was $150,000, the balance apparently going for working the mine, thus illustrating what it costs to work some mines before the stockholders receive their dividends. We do not mean to say that the expenses of the mine are always as great as they have been the past month.

State Treasury.—The money contained in the State Treasury, on the 30th of April, amounted to $388,229.87.

Summary of Mining News.

Washoe.

The Virginia City *Union* says that work is being vigorously prosecuted on all the big claims in Virginia which have erected hoisting works, as the Best & Belcher, Dick Sides, White & Murphy, Central No. 2, California, and other claims on the Comstock lead, which are excellently located, but as yet are undeveloped. Big strikes are bound to be made in some or all of these before the summer passes. Most of them have their shafts down to a proper depth, and have commenced drifting.

Belvidere.—The old Belvidere Gold and Silver Mining Company are going to turn over a new leaf and put their work through with a rush. A new set of trustees has been elected, and Mr. Charles Harvy —one of the newly elected trustees—has been authorized to proceed to this city and procure suitable machinery for steam hoisting works. The new trustees are in for immediate development.

The Buckeye Mill.—This quartz mill, which is situated near the mouth of the Santa Fe tunnel, is at present engaged in crushing Gould & Curry rock. It contains two batteries of four stamps each, with corresponding amalgamating pans, and the reduction of ore is carried on after the most improved plan.

The Moray.—The Moray shaft is 320 feet in depth, with a drift to the west 125 feet in length. They have passed through a large ledge, which was barren at the point cut by their tunnel, and are now running for a lead further west, and which they suppose they will strike in going 25 or 30 feet further. Their hoisting is done by means of a whim.

The Eddy & Co. Claim—This mine, which is situated on the hill immediately north of Crown Point Ravine, in Gold Hill district, was located in December, 1862, and contains eight hundred feet. It has been worked almost constantly since, and an incline two hundred feet has been sunk on the west wall of the ledge. The workmen are about to drift across the ledge in an easterly direction, and ascertain its width and the character of the rock it contains.

Sam Patch Gold and Silver Mining Co. is situated in the hill near the Gilmore, and about three hundred yards south of the Napoleon Company's claim. The company are running a tunnel for the ledge, which will tap it at a depth of over four hundred feet. The tunnel, which is well timbered, has now reached a length of 195 feet from its mouth, and it is estimated by the Directors, that one hundred feet more will strike the ledge, which is to be seen in an old shaft sunk upon the croppings, but on which work was stopped by a large stream of water. The rock taken from this shaft assayed $136.58 to the ton.

The Gentry is a Gold Hill claim, located last January, just in front of the Union, Yellow Jacket and that range of mines. The company claim 800 feet upon a ledge running northwest and south, crossing the Yellow Jacket. A shaft was commenced in February last, and has since been sunk to the depth of 66 feet through solid quartz. Sixty feet down, a well defined and apparently rich ledge was struck. A drift has been started from the bottom of the shaft for this, and rich rock is now being taken out. Good judges have confessed their inability to distinguish between the Gentry specimens and the better class ores. The work is now prosecuted with three shifts. The Yellow Jacket having run a drift under the Gentry works and broken through into them, the two companies have been engaged for several days in attempts to smoke each other out, which is rather an amusing episode in mining affairs.

The Lundin Co. is located in the upper part of Silver City. The Company hold 1,400 feet on each of nine parallel veins. The Company's tunnel is now in 415 feet. They have passed through two veins, and at last accounts were just coming upon the third. The main ledge has not yet been reached. The first ledge struck shows some gold; the second, mostly silver, with a little gold.

Cook & Gray Co.—This Company holds 600 feet, about one quarter of a mile north of Silver City; the stock is principally held by Messrs. Cook & Gray. The mine has been worked since '60; the Company are running a mill on Carson river. The bullion thus far taken out has amounted to fully $50,000.

The Mary Ann Co. has commenced work again, after a cessation of a few weeks in consequence of the litigation with the Uncle Sam. A late order of the Court allows the Mary Ann to commence work again. The Company are putting down a main working shaft, with a whim. Steam will soon be employed.

The Schuylkill Co. is an old location, but the work has not heretofore been prosecuted with much energy. They are now sinking a new shaft, and will put on a strong force of drifters as soon as the ground is properly opened.

The Keystone and Arrington Co. is a consolidation of the Keystone No. 2 and the Arrington. The Company's claim is located on the west side of Gold Canon. They are sinking a double shaft. The claim is thought to be located on a good mineral range.

The Belcher has been very much inconvenienced of late by water, and what is quite singular is that the flow of water is intermittent—sometimes gaining several feet on the pump in a few hours, and at another not affording full employment for it at even decreased speed.

The Midas Company is still sinking. They are now down 240 feet, with wet ground, which renders the work slow and disagreeable.

The Crown Point Co. started their pump on the 27th ult., and in a couple of hours had lowered the water in the shaft considerably. The water has been standing in the shaft about two weeks, and has become stagnant, so that when it is pumped out it emits an odor much less fragrant than the breath of roses. The water is probably out ere this and work re-commenced.

The Colorado, on Cedar Hill, was located in March, 1863, as the first south extension of the Utah, and contains 1,400 feet. The cutting of their ledge by the Morning Star Company in their tunnel a few days ago, has given an impetus to this Company's operations. They are now enlarging their shaft. When they have enlarged it to the depth of 75 feet, the depth of the original shaft, they propose to commence running night and day till they are down 200 feet, and then drift to the west for the ledge.

The New Oregon have commenced a new shaft a short distance to the west of their dump, upon the American Flat road, and directly over the shaft sunk at the end of their tunnel. Previous to being driven from the latter by water, they took out a quantity of ore of such a quality that they intend to order an engine and pump, so as to have them in readiness by the time their new shaft is down to their tunnel. Their energy and perseverance are certainly deserving of success.

Humboldt.

Moonlight.—Work on this mine has been suspended for the present. A cave in the drift rendered necessary a considerable amount of timbering, in order to work with safety and advantageously. The vein, where work left off, is very rich; a ton tried at the mill this week yielded 21lbs. bullion, worth $252.

"Gideon Band."—These two Companies have made an arrangement to work jointly for the purpose of running a tunnel to prospect their series of ledges. It is estimated that six assessments, of fifty cents per share each, will prospect all the ledges at a good depth. The prospects in croppings are fine, and the location favorable for working.

Cedar Hill.—This claim holds its good reputation. The shaft is something over 100 feet down, all the distance in the ledge. Ledge averaging about three feet width. Well cased, quite hard, and scarcely a piece to be picked up in which silver stain is not perceptible, or which will not yield gold. Work going on finely.

The Anderson has done about twice the amount of work of any other in Buena Vista District, and is driving work vigorously forward, intending to have the claim thoroughly prospected this season. The boys are now putting the incline down into the heart of the mountain, taking out the ledge as they go. The ledge is about thirty inches at eighty feet down, and widening. It is well cased in slate.

"Union Band."—This is one of the early locations for the Sheba series. All companies located for this series have been greatly encouraged by the recent strikes in the Sheba and De Soto tunnels, and are getting to work. The articles of incorporation of this company, provide, as a protection to poor owners, that assessments shall not exceed one dollar per share monthly. A good idea.

Tallulah.—A lot of 3,700 lbs. ore, from the Tallulah, yielded a bar of 282 ounces.

Gem of the Sierras.—A recent crushing of eight tons of rock from this mine, located in Sierra District, yielded $1,823 29 in fine silver bars. The crushing was done at Price & Fall's mill, Unionville, Humboldt, and the rock obtained from a shaft sunk thirty-five feet on the ledge.

A rich vein of copper, prospecting over fifty per cent. has been discovered at Sawyer's Bar, on Salmon river, in Siskiyou county.

[Written for the Mining and Scientific Press.]

The Whitman Mine.

Messrs. Editors:—Considerable has been said concerning the Whitman mine in our sister district, and, to all appearances, it is a failure; but I assure you that the Whitman is only passing through the same *refining* process that every mine of value has been subjected to in the Territory. I do not hold a foot of stock in the company, nor have I a friend that does, to my knowledge. But let me advise all concerned to hold on to their stock. I can have no object in this other than to advise those concerned for the best. I am living here, and understand the whole arrangement, and I know the mine to be rich. There is a large amount of the ore at the mine, at this time, that will work $1,000 per ton. The mill, it is said, will start again in a few days. It may make another failure; but if it does I assure those interested that it will not be on account of the inferior quality of the rock, but for some other purpose. Why is it that somebody, who had considerable to do with the mine, is buying all the stock he can get his hands on, at this time?

This is doubtless a rich district, and only wants to be developed. Many companies have gone to work in good earnest. The following are the names of a few who are doing good work: Altamonte, Independence, Amazon Tunnel—three shifts, Rappahannock, Union, Prairie State, Buckeye, Montezuma and the Yuha. There are hundreds of incorporated companies that have done more to hurt the district, by scattering their worthless stock through the country, than the failure of two Whitman mines could do.

Como, N. T., April 28, 1864. Como.

[The above correspondent is well known to us, and his word may be relied upon.—Eds. Press.]

Oriental Copper Mine, Amador Co.—A Strike of Silver.—Work upon the Oriental mine is still continued. Two shafts have been sunk to the respective depths of 90 and 100 feet—both terminating upon the same level; and a gallery is being run to connect them. When this is accomplished the mine will be in a condition for thorough and effectual ventilation (one shaft having its opening at an elevation of 60 feet above the other—a condition precedent to natural ventilation). As soon as the connecting gallery has been completed, stoping will be commenced. Mr. Fish, one of the proprietors, a few days since, showed us a specimen of ore taken from near the bottom of the deepest shaft, which contained a large quantity of black sulphurets of silver. These sulphurets contain, by assay, $1,756.83 of silver, and $240.80 of gold. We are not advised with regard to the extent of this deposit; but it is a very rare occurrence to find even a small deposit of that nature in immediate contact with sulphurets of copper. The discovery is certainly a most flattering indication of the value of the mine, and we shall be pleased to learn more particulars with regard to its extent and position in the mine.

Carson Hill.—The late developments in the Melones Ledge, Carson Hill, appear to have given a renewed impetus to the progress of other mines in that vicinity. Carson Hill, in the early history of quartz mining in California, occupied a most important position, and attracted a larger share of attention than the quartz mines of any other portion of the State. In 1851, over a million of dollars in gold was taken out of the Morgan claim on this celebrated hill, in the vicinity of the Melones, the Main Stanislaus and the Melones Sink. The latter has not a historic name, certainly; nevertheless it conveys a good idea of the locality immediately adjoining and underneath the depression of the Carson Hill, partly forming a basin or sink for a deposit of the precious metals and their matrixes, in their prolonged passage under Carson creek, where they are easily traced, until their bold croppings again appear on the opposite hill. The similarity of the rock to the Morgan and Melones, and the quality of the rock being the same, renders it quite certain that the Melones Sink and Main Stanislaus are on the rich gold-bearing belt of that locality.

Gold and Silver ore, and Sulphuret Assayers', or Silversmiths' sweepings reduced or purchased.
COPPER ORES—Highest market rates advanced in cash, for Shipments. S. C. BRADSHAW, Agent,
509 Sacramento street, near Sansome.

Farrand's New
AMALGAMATOR & SEPARATOR!
THIS UNRIVALLED MACHINE IS NOW IN OPERATION AT THE
Eureka Metallurgical Works,
Commercial Street, between Front and Davis,
WHERE ALL KINDS OF ORES ARE REDUCED AND SAMPLED.
Particular attention given to Sampling Copper Ores.
This Amalgamator is capable of doing double the amount of work of the ordinary pans, at a saving of one half of the power, and at a much less cost in the original purchase.
Another very important advantage connected with this machine is the fact that it may be cleaned in fifteen minutes, without removing the plates or any other portion of the machine.
Manufactured at the Miners' Foundry, San Francisco. All communications should be addressed to R. L. OGDEN, Agent.
Cor. Montgomery and California streets, San Francisco.

Advantages of Farrand's Amalgamator.
In offering this Amalgamator to the public, the inventor does not claim any new or scientific method of extracting the precious metals from the ores; he merely claims a new and simple combination of mechanical principles, whereby a great saving of power (full one-half in amount) is effected. The capacity of the machine varies with its size, the smallest, or prospecting size, will reduce 300lbs. in three hours, and can be easily worked by the power of one man. The largest size will work 1,800lbs. every three hours, or six tons in 24 hours, with an application of a trifle more than one-horse power. This saving of power, as all mill-men are aware, is a very important consideration, particularly in localities where fuel is scarce. The power so saved in running the Amalgamators may be advantageously employed to an increase of stamps, and thus proportionally increasing the work of the mill. This machine consists of a semi-cylindrical, trough-shaped vessel, the interior of which is furnished with moveable concave dies, to be replaced when worn out, as in ordinary pans. The mullers are convex, and attached to a substantial rock shaft, by which they are moved back and forward by crank or eccentric motion. The mullers are held to their places by springs of moderate strength, the pressure of which may be easily regulated. The oscillating motion of the mullers serves to keep the pulp in a constant state of agitation, thoroughly mixing it and passing it under the mullers without resort to any of the various expedients employed in Pans where a circular motion is maintained. In working this Amalgamator no quicksilver is placed in the pulp until the trituration is completed. That done, the mullers are raised, so as to completely break contact with the dies, the quicksilver sprinkled into the mass and the machine set in motion again, the mullers simply acting as stirrers, which they do most effectual. The peculiar construction of this machine admits of its being worked with a much smaller charge of quicksilver, to any given amount of pulp than Pans. The spiral springs greatly assist in the work of reduction, by allowing the free admission of the pulp between the mullers and dies, so that the pulp is made to actually work upon itself—as the dust of the diamond is made to reduce the gem itself. The advantage derived of thus avoiding all trituration in the presence of quicksilver, must be apparent to every one at all acquainted with gold or silver amalgamating. Trials made with this machine in the presence of experts, during the last four months, have been pronounced highly satisfactory. It is peculiarly well adapted to employment by small mining operators in distant localities, as it can readily be taken to pieces and packed upon mules. It is intended to construct a large size machine, without dies or mullers, but simply with arms, to act as stirrers; said machine to be used in connection with several of the Amalgamators as a "Separator," as it is found that the peculiar motion given to these arms, in connection with the concave shape of the body of the machine, renders it most effectual for such a purpose. WM. D. FARRAND.
17-1m San Francisco, March 28th, 1864.

A GREAT INDUSTRIAL FAIR!

—TO BE—

Opened in San Francisco,

—ON—

THE 30TH OF AUGUST, 1864.

THE MECHANICS' INSTITUTE OF SAN FRANCISCO ARE preparing for an Exhibition of Arts, Inventions, Manufactures of Industry in general, upon a scale more grand, attractive and useful than ever before seen upon the Pacific Coast. Their Pavilion, built for the purpose, will occupy one of the city plazas, and will contain every convenience and appliance for an effective display. The Institute appeals to all persons within the scope of its influence, who are engaged in different branches of industry and art, to prepare and forward for Exhibition such articles as they may invent, discover, or make, that are useful, instructive, curious, or suggestive. There is scarcely an occupation in life that cannot supply some article that can be so considered, and by their public exhibition they may start the genius of invention in some other branch of industry or skill, the successful development of which may greatly enrich the State. The premiums and published reports of the Exhibition will widely advertise their qualities and merits.

Each age and country has new wants, which the progress of civilization creates and ingenuity gratifies. Those of our own day and section are improved methods and machinery for reducing ores of the precious metals. A striking feature of the Exhibition will be the number and variety of these, worked by the inventors. It is hoped that information most useful to the mining interest will be elicited. Miners are invited to send ores for exhibition, and trial, in quantities sufficient to be worked seperately in the different machines, in order to test both the relative merits of the machines and the value of the respective metallic veins.

The various Steamboat companies of the Pacific states and territories will, with commendable liberality, transport all articles intended exclusively for exhibition, free of charge, and Wells, Fargo & Co., in like manner, will take charge of them.

All articles forwarded should be labeled—"For the Industrial Fair," and be directed to C. B. Porter, agent.

Regulations for the Exhibition.

1—Persons intending to take part in the Exhibition are requested to make known their intention at the earliest practicable period, stating the kind of article or articles they intend to exhibit, and the probable amount of space required therefor.

2—The Pavilion will be open for the reception of articles for exhibition on Monday, the 22d day of August, and will continue open for that purpose until Monday, the 29th. The Exhibition will open to the public on Tuesday, the 30th day of August.

3—The name of every article should be attached to it; also a description pointing out its merits, when thought desirable by the exhibitor.

4—When articles are entered, a check for the same will be given, which must be presented and surrendered when the articles are withdrawn.

5—Articles intended for sale will be labelled accordingly, but cannot be removed until the close of the Exhibition, except by the written permission of the President.

6—Light, fancy or perishable articles will be received, or may be removed, at any time during the Exhibition, with the consent of the President.

7—All articles deposited will be at the risk of the owners, who are invited to be present during the hours of Exhibition. In the intervals efficient measures will be taken for the protection of property.

8—On the day following the opening of the Exhibition, each class of exhibitors will meet to choose, by ballot, their own Committees of Award; failing in this for one week, Judges will be appointed by the Executive Committee. The Executive Committee will award premiums for such articles as the several judges shall decide to be worthy of the same. The premiums will be delivered as soon as they can be prepared.

9—The morning of each day, until 9 o'clock, will be appropriated to the ladies, and gentlemen will not be admitted during that time.

10—In case of misunderstanding, application may be made to the Executive Committee, who will be at all times in attendance.

11—Steam power will be provided, that machinery of all kinds may be seen in operation; and every possible facility will be given to exhibit all working machinery to the best advantage.

12—Exhibitors or their agents will receive free tickets of admission when, in the opinion of the President, the articles exhibited by them have such value, interest, or merit as to deserve it; but the transfer of any such tickets will work a forfeit of the privileges conferred by them.

13—All communications to be addressed to H. D. DUNN, Corresponding Secretary.

Executive Committee.

B. & S. will attend, in a prompt and satisfactory manner, to the Incorporation of Mining and other Companies, the purchase and sale of Stocks and Real Estate, and the adjustment of accounts.

8v8-m

To Druggists and all Prescribing for Neuralgic and Nervous Cases.—Your attention is called particularly to the efficacy of WATTS' NERVOUS ANTIDOTE for the above. Feelings of humanity, independent of pecuniary considerations would prompt you to recommend it in all cases of Neuralgic Pains, Face Ache, from detective teeth, and the General Wasting Away and Debility of the Nervous System, if you could have the assurance that this was what it is purported to be—THE GREAT RELIABLE TRANQUILIZER AND RESTORER OF THE SYSTEM. It has been repeatedly prescribed in cases of excessive drinking, on the verge of Delirium Tremens, and even while laboring under its distressing influence, with astonishing results. It contains no preparation of Opium or Valerian, and is never accompanied with the unpleasant sensation always experienced after taking successive doses of them. It is also the best Soothing Syrup in use. Patients have taken Watts' Nervous Antidote many months in succession, and experienced no unpleasant effect whatever—while the same continued use of many other popular remedies has completely shattered the system.

For sale, Wholesale and Retail, by SAMUEL ADAMS, U. S. Drug Store, corner of Pine and Kearny Streets, San Francisco. 6v8-3m

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

PACIFIC IRON WORKS,

—MANUFACTURE—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangments will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver Suite Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

DIPHTHERIA is an inflammation of the throat, very analogous to croup, except that instead of attacking the breathing apparatus it affects the tonsils and swallowing apparatus. True diphtheria, says Dr. Rand, of the Franklin Institute, of Philadelphia, and for many years a medical practitioner, is rare and very fatal. It is accompanied with an exudation of lymph matter. A large number of cases of sore throat, quinsy, etc., are called diphtheria, when nothing like it exists.

MAPLE SUGAR.—*Hunt's Merchants' Magazine* estimates the crop of maple sugar at 28,000 tuns yearly, or 62,700,000 lbs. But a very much larger amount can be produced, and doubtless will be, thus relieving the country to that extent from foreign indebtedness.

THERE is more nutrition in one pound of cheese than in two pounds of flesh. With us cheese is regarded rather as a luxury, while in England it is regarded as one of the substantial articles of food, and it is not uncommon for the workmen there to make a full meal on bread and cheese alone.

DR. MAPOTHER, of London, has just startled the world with a paper, read before the Bay College, in which he assumes that the bleeding of meat intended for food, impairs its nutritious value—that the strength of meat is the blood, and that it should be retained.

TREASURE SHIPMENTS.—The Reese River *Reveille*, of April 26th, says:—"Since the 1st of April, Wells, Fargo & Co., have shipped $20,391.98. Dr. Rodgere, the agent, estimates the shipment for the month at $40,000. For the past week Messrs. Paxton & Thornburgh have shipped 11,316 ounces.

CORN found at Rome has yielded very closely the same proportions of carbon, hydrogen and oxygen as fatty coals—involving just such a change as is due to decomposition by heat.

The MINING AND SCIENTIFIC PRESS comes to us enlarged to double its old dimensions, and otherwise improved. The PRESS is the only journal on this coast devoted exclusively to mining and scientific matters, and should be read by miners everywhere. It is published weekly, at $5 per year.—*Oroville Union.*

A. S. HALLIDIE & CO.,

WIRE ROPE MANUFACTURERS.

Established 1857.

Office, No. 412 Clay street—Works, North Beach, SAN FRANCISCO.

After seven years' use throughout the State of California and the Pacific Coast generally, we can confidently recommend Wire Rope for

HOISTING FROM DEEP MINES,
GUY ROPES FOR DERRICKS, &c.,
STANDING RIGGING FOR SHIPS,
FERRY ROPES FOR FERRIES,
SASH CORD FOR WINDOW SASHES,
ETC., ETC., ETC., ETC., ETC., ETC

It being Cheaper, Stronger, Lighter and More Durable than any other kind of Rope, and not stretching or shrinking by atmospheric changes.

MINING COMPANIES, by using it for Hoisting Purposes, save 66 per cent. on their outlay for other ropes.

Wire Fencing Strand,

For fencing large parcels of land—permanently, economically and expeditiously. Manufactured in any length desired.

Pamphlets containing weight, strength and price, forwarded free application to the Manufacturers.

WIRE SUSPENSION BRIDGES AND AQUEDUCTS

We are prepared to erect, of any span and capacity, and take pleasure in referring those interested to the many structures of this kind built by us in California, Oregon and British Columbia, of span from 200 to 400 feet. 3-3m

MINERS' FOUNDRY
—AND—
MACHINE WORKS,

First street, between Howard and Folsom streets, SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the **Best** and **Most Economical**, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

tf. HOWLAND, ANGEL & KING.

Vulcan Iron Works Company.

P. Torquet.....Manager.
Steam Engine Builders and Boiler Makers, Iron Founders and General Engineers,

PUMPING, HOISTING, MINING AND QUARTZ CRUSHING Machinery. Shoes and Dies of the hardest Iron. Russia Iron Punched Screens, Steamboat Machinery, Saw, Flour and Sugar Mills. High and Low Pressure Boilers of all styles. JONVAL and other Turbine Water Wheels with latest improvements.

tf No. 187 & 189 First Street San Francisco.

IMPROVED WATER-WHEEL,
—PATENTED BY—
John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15y8-3m Golden State Iron Works, San Francisco.

WHEELER'S
Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

***These Pans may be seen in daily operation at the Miners, Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

We have received the first number of the eighth volume of this interesting paper. It is now under the control of friend Dewey, and has been enlarged to sixteen pages. We commend it to miners, stock dealers, and others taking an interest in the development of the m'-l lands of this State. It can be had for $5 a year, and if preserved will make two volumes of interesting matter, containing 416 pages each.—*Red Bluff Independent*

Sonoma County Gold, Silver and Copper Mining Company, Cloverdale District, Sonoma county, California.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment levied on the 15th day of January, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
W. S. Pearson		100	$10 00
G. P. Swift	75, 76, 77, 78, 79, 80, 81, 82	208	20 80
E. Swift (4th & 5th asst)	11, 61, 62, 63, 89	221	44 20
H. A. Thomas (4th and 5th asst)	55	8	1 60
H. T. Graves (4th and 5th asst)	9	10	2 00

And in accordance with law, and an order of the Board of Trustees, made on the 14th day of April, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the salesroom of Jerome Rice & Co., on the 16th day of May, 1864, at the hour of 11 o'clock A. M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

A. B. GRAVES, Secretary.
17-4t Office, 412 Clay street, San Francisco, Cal.

Whitton Gold and Silver Mining Company, Silver Mountain, Alpine county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of April, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable immediately to the Secretary, J. Warren Clark, 430 Montgomery street, San Francisco, (Room No. 5, 3d floor) or to S. A. Bartlett, Treasurer, Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on the 21st day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of June, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
Office, 430 Montgomery street, San Francisco. 17

Rubicon Gold & Silver Mining Company No. 1.—Location of mine, Keys District, Owens River, Mono county, California.

Notice is hereby given, that, in accordance with the laws of the State of California, and an order duly made by the Board of Trustees of the Rubicon Gold and Silver Mining Company No. 1, there will be sold, at Public Auction, to the highest bidder, for cash, in United States gold coin, on the 24th day of May, 1864, at 11 o'clock A. M. of that day, at the office of the Company, No. 7 and 8, third floor, No. 302 Montgomery street, San Francisco, so many shares of the capital stock of the Company standing in the names of the following persons, or shareholders, as will be necessary for the payment of Assessment No. 4, of ten (10) cents per share, duly levied thereon February 27th, 1864, by the Board of Trustees, together with the expenses of advertisement and sale, unless said assessment and accruing charges are previously paid.

By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

16-4t No. 322 Front street, San Francisco.

Enterprise Tunnel & Mining Company, Reese River Mining District, Lander county, N. T.—NOTICE.—There is delinquent upon the following described stock in the above named Company, on account of assessment levied on the 23d day of October, 1863, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	Certificates.	Shares.	Amt.
Chas. Smith,	Nos. 81, 82, 83, 84	100	$25 00
A. Heidenheimer,	Nos. 86, 87	50	12 50
Otto Kapuz,	Nos. 55, 56, 57, 58, 59	50	12 50
S. Kezzel,	Nos. 92, 93, 94, 95	100	25 00
W. Blum,	Nos. 96, 97	50	12 50
Daniel Fonly,	Nos. 98, 99	50	12 50
G. Schmidtbury,	No. 39	10	2 50
A. Lamb,	No. 38	15	3 75
C. W. Skinner,	Nos. 108, 109	100	25 00

And in accordance with law, and an order made by the Board of Trustees on the 12th instant, so many shares of each parcel of said stock as may be necessary will be sold, at the office of the Company, in the city of San Francisco, at 12 o'clock M., on SATURDAY, the 14th day of May, 1864, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

J. F. STIRLING, Secretary,

No. 502 Montgomery street, Room No. 1, 3d floor.

San Francisco, April 16, 1864. 16-td

Mount Zion Gold, Silver and Copper Mining Company, Clayton District, Contra Costa county, Cal.

Whereas, the Board of Trustees of the Mt. Zion Gold, Silver and Copper Mining Company did, on the 5th day of March, 1864, levy an assessment (No. 11) of twenty-five cents upon each and every share of the capital stock of said Company, legal notice of which assessment has been given to the Stockholders thereof; and whereas, the said Board of Trustees did, on the 5th day of April inst., declare delinquent all of said assessment then remaining unpaid, and order the same advertised for sale, in accordance with the laws of the State and the by-laws of the Company; therefore, notice is hereby given, that there will be sold, at the office of the Secretary, No. 240 Montgomery street, on MONDAY, the 16th day of May, 1864, at 12 o'clock M., a sufficient number of the shares of the capital stock of said Company, standing in the names of the following Shareholders respectively, to pay the said assessment, together with the costs of advertising and sale of the same, unless said assessments and costs of advertising shall have been sooner paid, to wit:

There is delinquent upon the following described stock, on account of assessments levied on the 21st day of March, 1864, the several amounts set opposite the names of the respective shareholders as follows:

Names.	Certifs.	Shares.	Amount
C. H. Dorlot	17, 18, 19, 20, 21, 22, 23, 24	200	$100 00
E. Y. Mason	3, 4, 5, 6, 7, 8, 38, 39, 40	175	87 50
Wm. P. Pool	34, 36	10	5 00

And in accordance with law, and an order of the Board of Trustees made on the 21st day of April 1864, so many shares of each parcel of said stock as may be necessary will be sold at the salesroom of John Middleton & Son, No. 400 Montgomery street, San Francisco, on Saturday, June 11th, 1864, at 12 o'clock, M., of said day to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

W. AUGUSTUS KNAPP, Sec'y.

19-5t 620 Washington street, Room, 3.

Henry & Barnard Consolidated Gold, Silver and Copper Mining Company, Weaver District, Arizona Territory.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment levied on the ninth (9) day of March, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
S P Taylor,	194	2	50

Mining and Scientific Press.

A Mining Journal--Devoted to News, Art, Science and Progress.

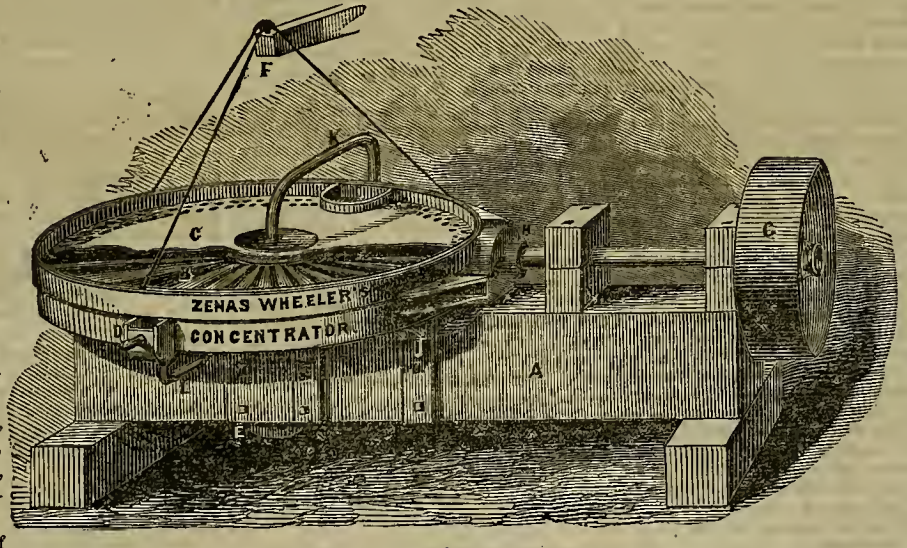
VOLUME VIII. SAN FRANCISCO, SATURDAY, MAY 14, 1864. NUMBER 20.

Contents:

No. 20—May 14—Twenty Pages.—Wheeler's New Patent Concentrator, Illustrated; Colorado Mining Stocks; The Formation of Metallic Veins, No. III.; Auriferous Pyrites; The Patio Amalgamation; MINING SHAREHOLDERS' DIRECTORY; Stock Reports for the Week; Reese River Stock Board; Washoe Stock Reports; Mechanical Department—Cold Welding; Patent Department—New Discoveries and Inventions; Silver Mines in California; Mining Gossip—Mysterious Feature of the Week; Mining Items; Editorial Paragraphs; Reese River Correspondence; New Incorporations.

WHEELER'S NEW PATENT CONCENTRATOR.

The annexed engraving represents a new concentrator recently invented by Mr. Zenas Wheeler, of this city, and already briefly alluded to in a late number of this paper. This machine is constructed upon the principle of a "center discharge," and vibrating disk. The pan may be made of iron, wood or other material, and of any convenient size, say from four to six feet in diameter, having a journal under it, to hold it in position, and upon which to vibrate. This journal is hollow, and forms the discharge pipe of the pan. The pan is so constructed that its center surface is two or three inches higher than the surface at the periphery, and as it is fed at the periphery, the sand must necessarily work its way *up hill*, to the center to find a discharge. This the lighter portion readily does, by the aid of the peculiar vibrating motion given to the pan —the heavier portion, consisting of sulphurets, amalgam, or free gold, remains near the circumference.



A represents a frame of wood upon which the pan is built and supported.

B is the pan which consists of a corrugated surface, radiating from the center, as is shown in the engraving.

C is an amalgated disk, one half of which only is shown, with a bowl in the center, from which the water and ore is equally distributed over the disk, and passes down through the holes at the water edge, into the corrugated pan below.

D is the outlet, or discharge for the excess of the concentrated matter, such as sulphurets, etc., while the machine is in motion. This discharge is regulated by a gate or slide, which can be adjusted to any required hight, so as to allow the proper amount of concentrated matter to pass out from under the waste and lighter matter which finds its egress through the center discharge.

E is the hollow journal through which the waste matter is discharged.

F, the rods for supporting the pan and its contents.

G, the driving pully on the cam shaft.

H, cam for vibrating the pan. The form of this cam is an involute, whose evolute is a circle, the cam being of the proper length to give the pan a motion of about ten degrees vibration. This peculiar form gives the pan nearly an equal velocity in every part of its vibration, causing it to stop and start so suddenly as to prevent the sand from packing on the bottom of the pan.

R, the pipe for supplying the pan with water and ores.

L, a pipe for drawing off the excess of mercury as fast as it accumulates.

The working of the pan is substantially as follows:—The pulp is fed, as already described, into a bowl in the center of the convex disk C, and flows out of this, evenly, over all parts of the said disk, and down through the holes in its periphery, into the corrugated pan below, where the quicksilver, amalgam and heavy matter is collected by means of inclined grooves near the outlet D; the quicksilver, as fast as it increases in excess, being constantly discharged through the bowl and pipe at L, into a dish by itself, while the sulphurets, as fast as they accumulate, are discharged into another vessel through the opening D; the waste matter passes out through the hollow journal in the center of the pan, and is discharged at E. It will thus be seen that the entire operation of this pan is automatic, both in principle and fact. Its great advantage over pans of similar construction consists in this perpetual discharge of quicksilver and amalgam into one vessel, and sulphurets into another, while the machine is in motion.

The Triunfo.—We have received the Second Annual Report of the Secretary, Henry S. Brooks, Esq., of the Triunfo G. and S. M. Co., which is located in San Antonio district, Lower California. This report is well and carefully prepared and gives quite a full detail of the transactions of the past year, together with a general review of the business of the company, its financial condition, etc. It is just such a document as should be issued, at least once a year, by every incorporated company which has stock floating in the market.

COLORADO MINING STOCKS.

The New York *Mining Journal* says that gold stocks are fast becoming a fixed fact in that market. The following are some of the Colorado quotations in New York:—

	Latest quotations.	Par value.
Quartz Hill	$25@25¼	$25
Gregory	25@26	50
Hope	12¼	25
Denver	10	20
Central	10@10¼	20
Montana	75c@$1	5

Heavy transactions are constantly taking place in Colorado. The last Colorado *Mining Journal* says that H. W. Dorsett has sold one-third interest in three claims on the Orphan Boy, in Park county, for $75,000 cash. Hostetter & Williams have sold another third of the same property for $60,000. Other parties have made sales, and excitement runs high in consequence. Gentlemen from Denver, where people are more insane, if possible, than they are in the mines, are visiting the South Park region with a view to speculating. Some six hundred companies are already organized under the territorial incorporation law, one of which, the Black Hawk Company, has a capital of $5,000,000.

Colorado, like California, is sorely troubled with "wild-cat" schemes, which never have possessed, and never will possess, any value. Of course when they are bought and sold somebody must be defrauded, and stocks of real value must suffer. Among this worthless class of stocks, may be ranked many of the so-called extensions, which are taken up to an indefinite extent, along the supposed line of every vein which has any value in the market. Of course many extensions are valuable, as upon the Comstock in Washoe and the Gregory in Colorado. The trouble arises from the reckless manner of purchasing. Nearly all purchases are made blindly; one purchases because another has just done so, and thinks it perfectly safe to pay the last price offered. To be successful in such operations requires both skill and judgment. Mining is a venturesome business at best, and, without extraordinary care and diligence, cannot fail to be a losing one. Properly conducted, few are more profitable.

The Pacific Iron Works Co. have fixed their base of operations in the pleasant suburb of Oakland, where they are now erecting suitable buildings for carrying on their operations. The site located is near the long wharf of the Oakland Ferry Railroad.

Communications.

THE FORMATION OF METALLIC VEINS.

NUMBER III.

BY EDWARD A. MILES.

If the metallic elements of veins originate chiefly from sedimentary, and partially from erupted rocks, the inference is that wherever particular metals are predominant, the surrounding rocks must possess certain similar chemical elements. Such is really the case, for, in common with silica, magnesia is largely present near all gold veins, eruptively in serpentine and greenstone porphyry, and metamorphically in talcose and chlorite slate, where, in the latter class of rocks, much of it was undoubtedly brought during the same process that deposited the gold. There is a partial exception in case of veins in clay slates of the silurian system; but even in them there is but little gold unless the walls are of a talcose nature. Magnesian and stratic limestones occur among the lower series of geological strata, where, as before observed, gold veins most abound. The writer knows of no original gold formation where the magnesian minerals are not present. In the absence of gold, the magnesian associated veins usually contain copper. The magnetic oxide of iron, or its sulphuret, is also intimately connected with gold and magnesia. There is a positive relation between lime and silver, and also between lime and galena. Where porphyries contain hornblend, which equally holds lime and magnesia as component parts, both gold and silver are present in their metallic veins. For general proof of these facts, the writer refers to every known mine in Europe, South America, Mexico, Washoe, and California. Most of the principal veins and mining sections of the two latter regions having come under his own personal observation, he can speak thereof with a great degree of certainty. No silver lead is found in Washoe unconnected with a calcareous formation, nor any of its gold yielding veins, or those of California, of any importance, free from the vicinity of an erupted rock containing magnesia. Certain strata, of particular geological epochs, are remarkable in every portion of the globe for the abundance and character of their metals, tin, zinc, mercury, antimony and bismuth having geological zones of ruling existence or quantity, as well as the metals previously mentioned. Iron being extensively dispersed throughout the earth's crust, is, as might be expected, present in nearly all metallic veins, and is the only useful metal which exhibits any traces of eruptive and massively sedimentary origin, as in veins of the siliceous and beds of the oxide forms. The condensation of metals in sedimentary strata with certain affinitive elements agrees with the fact, that veins in the older erupted rocks are seldom devoid of noble and useful metals, while such sedimentary formations as sandstone gather little or none in their veins, and that the richest mines of the world are found in altered and unaltered sedimentary strata, even where large areas of erupted rocks prevail. It is also substantiated by the fact, that a vein passing from one mineralogical formation into that of another composition changes the character of its metals as well as the degree of richness.

The writer holds the system of rocks connected with all considerable metallic deposits, (except, perhaps, those of iron) are voltaic batteries on an immense scale, and that all metallic solutions and after impregnations in veins or masses are due to the low but constant current of electricity engendered within them.

The metallic impregnation of veins might be simply considered as a chemical operation, but for the fact that no other power in nature but that of electricity gives analogous effects when reduced to visible action, nor can account for the peculiar phenomena of metallic combinations. Metals and elements far apart in volatility and specific gravity are found proportionately and regularly united in one homogenous compound, such as could not be produced by the sole effect of heat nor by simple deposition from mechanical or chemical solutions. And these connections correspond, in almost every respect, with their peculiar electrical affinities in all galvanic experiments. For sake of simplicity of explanation the infusion of veinstone has been treated solely as a chemical operation, although there can be no doubt but that electricity is the prime worker in all stages of the formation. Fox and Reich, two scientific experimenters, have demonstrated the existence of electrical currents in metallic veins by attaching the two wires of a galvanometer, or indicator of electricity, to different parts of the same vein, the strength and direction of these currents varying with the position and character of the surrounding rocks and the quality of the veins. It has also been proved, that two plates of rock in simple aqueous connection, and attached to the opposite poles of a galvanic battery, after a considerable length of time show much decomposition of the positive and proportionate crystalline accumulation on the negative piece. The agency of electricity in the primary and secondary changes of veins has been often surmised, but the writer is unaware of any attempt to systematically ally such a theory with all systems of veins, and the chief facts of vein running, nor of any plausible explanation of the derivation of metals.

The ordinary galvanic currents of batteries are caused by the mutual chemical action of a compound, as acid, and a simple body, as zinc, expelling an element of the former and substituting the latter, in which operation each sets free a surplus of its natural electricity not needed in the new combination, the more marked current from the zinc being termed *positive*, and that which flows in an opposite direction *negative*. To incite these currents and continuous chemical change, when the zinc is in contact with the acid, a third body, as copper, is necessary to act as a conductor to recombine the subtle fluids, or connect them with some active construction or decomposition. This bridging across of the extreme limits of flow of the opposite electrical currents by a conductor and connecting wire, either causes a neutralization to take place with a corresponding generation of heat, or an absorption within an interposed body capable of undergoing chemical secretion or decomposition through their influence. The latest views of modern science restrict not the electrical action to the required presence of a simple element uncombined with others, but extend the same mutual operations and effects to all compounds in nature, although in their case, by reason of the greater electrical equality of the resulting combinations, the free currents are less manifest. Not an atom of matter is mechanically or chemically changed in form or position, but brings electrical currents in play with greater or less evolutions of heat as their attendants. By the slight but continuous shifting of compound forms, regulated, perhaps, by the external changes wrought by the sun, currents of electricity ceaselessly engirdle the earth, and they are constantly destructive or creative. It is extremely doubtful if, aside from the action of gravity in sedimentary deposits, any solitary massive concentration of a simple element or its oxide form ever takes place in nature without the direct power of these currents to regulate the form and mode of deposition. It then becomes an important consideration regarding the ruling qualities of these currents. Different forms of this same cause are known as frictional, thermo, and voltaic electricity and magnetism. From its association with the great magnetic body, the earth, and with chemical changes, that which operates in veins may properly be termed electro-magnetic. The influence of electricity depends upon two conditions; first, *quantity*, which produces the effects of heat and ultimate chemical action, and second, *intensity*, or force, which is necessary to overcome the resistance of poor conducting medium. All bodies have different grades of electrical conduction, but their resistance increases with length and decreases in proportion to greater transverse area.

To prevent the electrical currents of nature from remaining intact or returning to their pristine relations, would seem to be the office of the sun, which in its diurnal journeys incites them to move in the planes of the earth, but certainly never under repeated relations of action. In truth, all engendered electricity has a disposition to move, either in the line of the length of the conductor, or else from the source to the most favorable point of emission or neutralization. Any upright, or nearly so, fissure or plate, containing such conductors as air, rock or water, must interrupt these currents, and, consequently, cause different conditions of quantity and intensity. In contact with the intruding medium a series of accumulations and neutralizations of the electricity will occur, producing the phenomenon of heat observed in the walls of all deep openings, and incorrectly ascribed to an internal molten condition of the earth. There is very little chemical alteration to be seen in undisturbed horizontal strata of rock, and their springs are generally pure, undoubtedly because their capacity for conduction is great in proportion to the quantity and intensity of electricity passing through them. While no collections of metal are found in the natural seams of horizontal beds of limestone, the massive portions of the rock, on the contrary, often hold deposits of lead connected with vertical fissures opening at the surface. As the greater or less length and depth of the interrupting fissures or plates, in comparison with the real center of final action, so must be calculated the proportionate effects. It is noticeable in galvanic batteries that there is always a greater chemical action in the plates about midway from the ends; a kindred action is remarked in true fissure veins, their greatest riches being found at intermediate depths, above and below which there is a decrease in the quantity of the predominant metals.

[To be Continued.]

Auriferous Pyrites.

The value of this important mineral, and the impression that, even by the most skillful and careful processes yet introduced for working it, a large amount of the gold which it contains is still lost, appears to be gaining ground among mill men everywhere. We have, from time to time, carefully noted the reported results of various experiments which have been undertaken to determine the most effective process for working this stubborn mineral. We have now before us a letter from Prof. A. L. Fleury, of Philadelphia, addressed to the editor of the New York *U. S. Mining Journal*, which will be read with interest. Mr. Fleury is well known at the meetings of the Polytechnic Association, New York, and the Franklin Institute, Philadelphia, for the results he has brought before them of the application of electricity in the puddling furnace and the decomposition of iron furnace and lays by caustic lime. The latter involves as large an economy in the production of iron direct from the ore as he now proposes in regard to gold:—

To the Editor of the U. S. Mining Journal:—In your valuable journal I have lately seen a number of new devices and processes for the extraction of gold from quartz, which present many valuable features; yet, there seem to be difficulties in the way of their practical introduction.

The decomposition of Pyrites by heat, assisted by air as well as by steam, has been tested in Europe as well as in this country, in the most varied ways; but though some inventors have asserted that they can desulphurize *all* gold containing pyrites without losing any of the gold, I have not had an opportunity to see this accomplished; and I believe that, to bring this most important fact about, other processes must yet be resorted to.

Notwithstanding the most positive assurances of some chemists, that the gold in ores always exists in a metallic state, it is my humble opinion (which at some future time I hope to be able to corroborate by unmistakable proofs) that gold can, and does exist in nature in a chemically combined state.

The fact so ably and beautifully demonstrated by Professor Faraday, in London—that finely divided gold can remain suspended in water for any length of time—leads me to think (and proofs are not wanting) that the gold which is contained in the pyrites of Colorado, California, Nova Scotia, San Domingo and Mexico, being in an immensely fine divided condition, is carried off in large quantities by the sulphur itself.

How much of the precious metal is carried away by the washing processes of the gold sand might well astonish your readers. I do not wish to frighten the companies and miners who use water for the concentration of their ores, and therefore I only state my personal belief, that at least one-third of the gold that is extracted is now washed away, invisible to the eye, which will at some future time, when we shall have learned better to economize, be made use of.

I intend to give you the reasons which led me to the discovery of my new method (of which I have explained to you the most prominent features) of working gold ores, and hope only that the economy in this now much coveted precious metal will cause chemists to turn their attention in a different direction.

A. L. Fleury.

Remarkable.—The Mississippi river about the mouth of the Missouri averages 3,600 feet in width. From there to the mouth of the Ohio it averages 3,200 feet; from the Ohio to the Arkansas to the Red river about 2,700 feet; and from the Red river to the Gulf of Mexico the average width is about 2,100 feet. Yet with this constant narrowing of the river the volume of water to be discharged is constantly increasing. Hence, it is contended, come those bayous which start out of the river and lead away into the swamps, and down in various directions to the gulf.

[Written for the Mining and Scientific Press.]

The Patio Amalgamation.

BY J. B. CHURCHILL, A. M.

I have been requested by the editors of the MINING AND SCIENTIFIC PRESS to undertake the task of describing the Patio process of amalgamating. I can only do so in the hope that by placing in juxtaposition the results obtained in the laboratory and *hacienda* some light may be obtained which may assist in solving the California problem—how to save more than 75 per cent.—the approved Gould & Curry standard of silver in our ores—how to save it under the difficult conditions of high-priced, unskilled labor, and scarce and insufficient supplies of fuel. Out of this process is said to have grown the Freiberg barrel amalgamation. Different improvements have superseded the latter method in Prussia, Saxony and Austria. In each of them we can trace this essential and distinguishing characteristic—they are adapted to the reduction of silver when this metal is present in the single form of chloride or sulphate—with more or less uniformity in the accompanying ores—a condition which is secured by previous roasting. In the Patio process, there are present at once, or there may be present, sulphate of silver, chloride of silver, metallic silver and amalgam, as artificial productions with silver in any of its natural forms, together with an indefinite variety and equally uncertain proportions of other metals, minerals and salts, both artificial and original. It is this point which constitutes the difficulty before us, as I think it will be also evident that it is this which has rendered abortive many experiments, some of them designed by men of great scientific attainments, and even when these have been made in the torta itself.

In order to facilitate the collection of information from such Mexicans as may be among us who are conversant with details, and may or may not be communicative, and for the help of those going to Mexican mines, I will commence by furnishing the following explanation of the terms locally used:—

Abronzado.—Yellow copper ore, sulphuret of copper.

Afinacion.—Refining.

Apartado.—Establishment for parting silver and gold.

Apuradores.—Men who wash the earth from the tinas.

Arrastra.—Mill for grinding ores.

Ascentado.—Term applied to arrastras in good working order.

Asciento.—Metallic residue in the bottom of the jicara.

Azogue.—Silver ore adapted for amalgamation.

Azogue en caldo.—Quicksilver.

Azogueria.—The wareroom in which quicksilver and pella are kept.

Azoguero.—An amalgamator; superintendent.

Bano.—The last portion of quicksilver added to the torta.

Barquina.—A large furnace.

Barquines.—Forge bellows.

Batea apuradora.—Large bowls 3-5 feet in diameter for receiving the cabetillaand re-washiag.

Beneficiar.—To extract the metal from the ore; to dress ore.

Beneficio.—Reduction of metal from the ore.

Beneficio de cazo.—Reduction of ore by amalgamation in copper pans with heat.

Beneficio de hierro.—Reduction of ore by amalgamation with fragments of iron.

Beneficio de pella de platn.—Term applied when silver amalgam is added to the torta.

Beneficio de la colpa.—Amalgamation in which colpa is added to the torta instead of magistral.

Beneficio por fuego.—Smelting.

Bollos.—Amalgam moulded into bricks, after pressing, for braing instead of retorting.

Boletas.—Tickets of accounts of sales and yields.

Bronce.—Iron pyrites.

Buytroa.—Furnace for smelting.

Burilnda.—Assay grains.

Buscones.—Tributors; miners on shares; prospectors; gleaners.

Cabetilla.—The residue after washing a *torta;* the heavier portions of ore very rich in amalgam.

Cajon de grauza.—The pit to receive the crushed ore.

Cajoa.—In Peru and Chili, two montons of thirty-two quiatals.

Cal.—Lime. Calviva.—Quicklime.

Calentadura.—The first heating of the furnace; putting the furnace into blast.

Calientes.—Warm ores containing sulphurets of iron and copper and no lime.

Calza, or Cal en piedra.—Limestone.

Calor.—Heat.

Calor de frio.—Term used when the reactions which are accompanied by heat when too much magistral is used, occur naturally from the coldness of the air.

Caparossa.—The person in charge of the sheds under which the *tahonas* are worked.

Capellinas.—Large iron or copper bells under which the quicksilver is separated from the silver in the amalgam by burning.

Carcamo.—The drain which carries off the earthy matter from the *tinas* when washing the amalgam.

Carga.—580 lbs. Spanish; a mule load.

Cargadora.—Term applied to the *tina* for receiving the material from the *torta.*

Casa de moneda.—The mint.

Caso.—A boiler used in hot amalgamation.

Castillo.—The frame of the stamping machine.

Caxo.—A measure containing many quintals; it varies in bulk; at Potosi it is equal to 5,000 lbs.

Cebar.—Term applied to the addition of quicksilver after the first charge; it also means the act of thoroughly mixing in the whole of the quicksilver with the wet *torta.*

Cebo.—The quicksilver so added.

Cedazos.—Sieves.

Cendrada.—The bottom of the refining or cupelling furnaces; made of fine earth and vegetable ashes, which have been leached; the materials of the cupelling test; the test itself.

Cendradilla o galeme.—The cupel.

Chapas.—Iron blocks on which the stamps fall.

Chino.—Iron or copper pyrites.

Colorados.—Ores containing native silver, or chloride, bromide or iodide of silver; also applied to ores colored with oxide of iron.

Colpa.—Colcothar.

Comalillos.—Furnaces for calcining pyrites.

Comillo.—A furnace.

Consumido.—The quicksilver required to reduce the silver to the metallic state.

Copola.—A cupelling furnace.

Copos, or Paxillas.—Little globules into which the quicksilver forms when the patio process is too quick.

Criba.—Perforated leather through which the stamped ore falls into the pit.

Cruces.—The cross pieces of the arrastra.

Cachara.—A spoon.

Cachara de cuerno.—A small horn bowl in which the earth of the tortas is washed, in order to ascertain from time to time the progress of the amalgamation.

Curtir.—Term applied to the addition of lime to warm ores, or of magistral to cold ores during the amalgamation.

Desecho.—Term applied to the mercury that appears broken up in the first trial.

Empleo.—The quantity of quicksilver mixed with the torta on any given occasion.

Ensalmorar.—The first process in amalgamation; mixing the saltierra with the lama.

Ensayo.—A trial test.

Esmanil.—Blende.

Estoraque.—Brown blende; sulphuret of zinc.

Frios.—Cold ores; those containing lime, and, therefore, requiring more magistral.

Galera.—A large shed or mill-house; also applied to the building in which the arrastras are arranged, generally in double rows.

Granza.—The coarse sand as it goes from the stamps to the arrastras.

Grena.—Ores in the rough before cleaning.

Hacienda.—Establishment for reducing ores.

Hacienda de beneficio.—Establishment for reducing ores by amalgamation.

Hacienda de fundicion.—Establishment for reducing ores by smelting.

Horno.—A furnace.

Horno de fundicion.—A furnace for smelting.

Horno de magistral.—Roasting stove for pyrites.

Incorporar.—In amalgamation, to add the first charge of quicksilver. See Cebar.

Jicara.—A small bowl for testing the tentaduras.

Lama.—Schlem, or slime, from the amalgamation.

Lamero.—Lama thickened with saltierra.

Lameros.—Lama pits.

Lavador.—A man employed in washing the ors after amalgamation, or in cleansing the ore.

Lavaderos.—Washing vats or tubs for separating the amalgam from the lama, also called tinas; the sheds in which these are arranged.

Ley.—Standard of the ore. Ley de oro.—Contents in gold. Ley de plata.—Contents in silver.

Limadura de plata.—Whitish appearance of the quicksilver on the edge of the amalgam when the process is going on well after the first quicksilver has been added; small leaves of amalgam.

Lis—Lista.—The broken up mercury which is brought to the surface of the tentadura in the jicara.

Macero.—The man who has charge of grinding the ores in the *tahonas* before the amalgamation.

Magistral.—Roasted copper pyrites containing sulphate of copper.

Manga.—A bag or strainer for straining the quicksilver from the pella, often made of sailcloth covered with leather.

Manganesa.—Manganese.

Maquila.—Rate paid to the proprietor of the mill for reducing ore on another man's account; applied chiefly to reduction by amalgamation.

Marco.—Eight ounces or one pound Spanish, equal to 3,552 grains English; used as well of standard as of unrefined metals.

Marquesitas.—Mundic iron pyrites.

Maza.—Stamp head for pounding ores.

Merma.—Loss of quicksilver in amalgamating, or of lead in smelting.

Metales plomosos.—Ores impregnated with lead.

Metapiles.—Stones for grinding of the *tahonas;* also pigs of copper used in the hot amalgamation.

Molienda.—The act of grinding or pounding ores.

La molienda.—The ores ground.

Molino, or Mortero.—Stamping mill.

Monton.—A heap of ore; a batch under amalgamation; a measure varying in different districts—at Catorce, 36 quintals; at Guanaxato, 35 quintals; at Real del Monte, Pachuca, etc, 30 quintals; at Zacatecas and Sombrerete, 20 quintals; at Fresnillo, 18 quintals; at Bolaaos, 15 quintals; and at Valenciana, 32 quintals.

Muestras.—Samples.

Mufla.—A tuyere.

Negros.—Ores containing sulphur, antimony and arsenic.

Ocre colorado.—Red ochre.

Pacos.—Earthy ores mixed with various ores of silver; when red, frequently called colorados; generally found near the surface.

Partido.—Division of ores between the owners and buscones.

Pasilla.—Dry-silver amalgam squeezed out in the jicara from the tentadura.

Patio de amalgamation.—The yard or court on which the ores are amalgamated.

Pella.—The silver amalgam when all the quicksilver which can be pressed out has been removed.

Pepenado.—Cleaned ores.

Pepenadores.—Laborers for cleaning ores.

Pepitas.—Small grains of gold or silver.

Perdida.—The loss of mercury beyond the amount allowed as consumido.

Pila apuradora.—The washing tank for separating the amalgam.

Pina.—The cake of silver left after distillation.

Planilla.—An inclined plane used for a second washing after separation of the heaviest ores.

Plata pina.—Silver after distillation.

Plata mixta.—Pina containing gold before parting at the mint.

Polvillos.—Ores fragile and rich; also the metallic sulphurets containing gold not amalgamated.

Polvorilla.—Black silver disseminated; sulphuret of silver.

Quilate.—Synonymous with carat. It is also an absolute measure, equal to four grains Spanish.

Quintal.—Four arrobas or 100 lbs. Spanish, equal to 101.45 lbs. English.

Raspando.—Scraping or cleaning up the arrastra.

Reboltura.—The mixture of ground ore and fluxes, or re-agents.

Rendirze.—Term applied to the torta when the amalgamation is finished.

Repasar.—The mixing together of the ore, quicksilver and other materials of the torta by treading, either by man or mules.

Repasadores.—Men who tread the torta.

Sala.—The principal room of the hacienda.

Sal mineral.—Mineral salt for amalgamation.

Sal tierra.—Impure or earthy salt.

Salineros.—Ores requiring much salt to effect the amalgamation.

Tahona.—A mill of small horizontal stones.

Tentadura.—An assay or trial.

Tepetate.—Rubbish after cleaning ores.

Tina.—A vat; stone tank.

Tina cargadora, ditto Descargadora.—The receiving and discharging tanks as arranged for separating the amalgam in the lavadero.

Tiro de mulas.—A set of mules.

Torta.—The quantity of ore under amalgamation, forming a flat heap or cake.

Torta rendida.—The yield ready for washing.

Vitriolo azul.—Blue vitriol; sulphate of copper.

Vitriolo blanco.—White vitriol; sulphate of zinc.

Vitriolo verde.—Green vitriol; sulphate of iron.

Voladoras.—Grinding stones of the arrastra.

Vuelta.—The bright glow on the surface of the silver when the last film of oxide of lead suddenly separates in cupelling.

[To be Continued.]

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

Table Mountain Copper Co.—A splendid specimen of ore from this company's mine, weighing upwards of 600 lbs, may be seen at the office of J. J. Robbins, No. 609 Clay street. This company have now ready for market 100 tons of ore worth $60@$75 per ton, 40 of which is on the wharf at Stockton. They are now down 150 feet in two shafts, with a well defined lead, carrying rich ore. Twenty-four hands are constantly employed at the mine.

Legal Tender Notes.

San Francisco, Friday May, 5.....61 per cent.

Morning Call Silver Mining Company, Wheeler and Rogers Ledge, No. 2, Big Creek District, Lander County, N. T.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 11th day of May, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 14th day of May, 1864, in United States gold and silver coin, to the Secretary, No. 11 Government House in the City and County of San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday the 11th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on WEDNESDAY, the 29th day of June, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. EDW. QRACKENBUSH, Secretary.

Office, No. 11, Government House, cor. Washington and Sansome Streets, San Francisco. 20-4t

Ophir of the Colorado, No. 1, Gold & Silver Mining Company, Location of Claim, El Dorado Canon, Territory of Arizona.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 7th day of May, A. D., 1864, an assessment of fifteen (15) cents per share was levied upon the Capital Stock of said Company, payable on the 8th day of June, A. D., 1864, to the Secretary in U. S. Gold Coin,

Any stock upon which said assessment shall remain unpaid on the 8th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 20th day of June, to pay the delinquent assessment, together with cost of advertising and expenses of sale. RODNEY CLARK, Sec'y.

Office, San Francisco, No. 520 Washington Street, Room No. 13. 20-4t

Record of New Incorporations.

The following is a record of the names of the companies, location of the claims, and the names of the Trustees mentioned in the articles of incorporation, filed in the County Clerk's office, in this city, since our last report:—

Swansea C. & S. M. Co., Arizona Territory; Eugene Crowell, E C. McComb, C. C. Chapman, A. M. Tichenor, R. H. Waller.

Cotopaxi S. M. Co., Gold Hill, N. T.; O. W. Easton, A. G. Randall, B. D. Dean. A. H. Jordan, James Harlow.

Wellington G. & S. M. Co., Santa Catalina Island; W. Ayer, C. W. Pool, G. E. Davis, B. F. Swan, Noble Lovely.

Pride of the Ocean G. & S. M. Co.; same as above.

Caledonia G. & S. M. Co., Santa Catalina Island; J. S. Curtis. T. J. Burke, James L. Crosett.

Brewer G. & S. M. Co., Amador county; E. S. Tibbey, William H. Payne, Wm. Hirschfield, J. G. Copp, F. A. Brewer.

San Salvador Commercial & Agricultural Co., San Salvador; J. McHenry, C. T. Fay, A. G. Gladding, V. B. Post, G. Dardano.

Center Copper M. Co., Nevada county, Cal.; Daniel McNell, S. H. Covert, E. W. Roberts.

Victoria Mining, Lumbering & Prospecting Co., Arizona Territory; Isaac Murray, E. L. B. Brooks, Darius Williams, S. McCullough, W. Muldrow.

St. Louis M., L. & P. Co., California, Nevada, Utah, New Mexico and Arizona; E. L. B. Brooks. A. F. Tilden, C. W. Langdon, E. V. Sutter, Wm. Muldrow.

Nugel and Tilden S. M. Co., Colorado district, A. T.; A. Nugel, T. Tilden, J. W. A. Gilmore, E. P. Peckham, A. F. Tilden.

Mochussa G. & S. M. Co., Sonora; L. Sylvester, Joseph Goldwater, Thomas Hopton, C. L. Jenkins, Henry Lampman.

St. Clair Consolidated M. Co., Reese River; F. L. A. Ploche, Jas. Phelan, Jacques Veiller, James Hunter, M. Kaye.

Provo Consolidated G. & S. M. Co., Santa Rosa district, N. T.; D. T. Berry, G. W. Damond, E. D. Farrington, J. M. Todd, S. R. Harris.

Columbian S. M. Co., Lander county, N. T.; W. E. Robinson, M. D. Howell, N. Proctor Smith.

Minnesota G. M. Co., Sierra county, Cal.; J. T. Bovee, Ed. Snell, J. E. Clayton, P. S. Hibberd and I. N. Thorne.

Lawrence G. & S. M. Co., Lander county, N. T.; John Dolbeer, R. W. Brett, Wm. Doolan.

Guilford G. & S. M. Co.; same as above.

NEVADA TERRITORY.

We gather from the Territorial papers the following names of mining companies which have recently filed papers of incorporation in Nevada Territory:—

West Burning Moscow G. & S. M. Co., Virginia district; A. A. Mace, W. Kessagu, F. A. Sawyer.

Sturgroon and Effingham Consolidated M. Co., American Flat; W. W. Bishop, C. C. McDonald, B. S. Nichols, Geo. C. Burnett, Wm. E. Hale.

Guardian G. & S. M. Co., Gold Hill district; A. C. Saxton, G. J. Cole, W. W. Coryell.

Taylor G. & S. M. Co., Gold Hill district; Wm. J. Taylor, C. S. Rees, W. A. Morrison, A. J. Rhodes.

DeWitt Clinton G. & S. M. Co., Gold Hill district; F. Downer, S. D. Young, S. H. Mather, J. J. Colfroth, H. V. S. McCullough.

Hathaway G. & S. M. Co., Gold Hill district; Thomas Peasley, A. Hecht, N. Solomon.

Clio G. & S. M. Co., Red Mountain district; Frank Park, W. S. Myers, George Stille.

Returns from Blue Mountain.—The Calavaras *Chronicle* says that the Heckendorn company have had another clean up at their mill, which proved even better than the first run. Owing to the low stage of water in that vicinity, the company have not been able to run even their four stamps all the time. From thirty-three tons of rock crushed, they took out ninety-six pounds and four ounces of amalgam. It is estimated that the rock will pay about $225 to the ton. This run settles the question. There can be no cavilings hereafter about Blue Mountain. It has proved a perfect success. We have as good silver mines on this side of the mountain, as they can boast of in the Territory.

The Alum Mine, in Monitor district, N. T., consists of a deposit from which a stream of water, strongly impregnated with alum, issues from a clay bank, and wherever the water stands it precipitates beautiful crystals. The deposit has not yet been prospected to any considerable extent.

Lumber.—The mills at Reese River are said to be hard at work, turning out lumber, from timber found on the surrounding hills.

Mechanical Department.

COLD WELDING.

Most of our readers are doubtless familiar with a fact which occasionally occurs, of the union of a spindle, while rotating rapidly, with the step in which it rotates, and by which union the motion of the spindle is of course instantly arrested. This union can take place only when there is no lubricating fluid present in the step, and only when the two surfaces are highly polished and, of course, very smooth. We have frequently heard the fact doubted by those who have not been familiar with its occurrence. The old system of plating was based upon this principle—that when two highly polished surfaces are forced in close contact by heavy pressure, they adhere and become one. Thus, in plating, a thin sheet of silver was made to adhere with great tenacity to a burnished surface of copper, when forcibly pressed together by being passed through the rolls of a flatting mill.

This process has been called "cold welding." By it steel may be welded to either steel or to soft iron. In Hecker's flouring mill, in New York city, the engine crank shaft is a heavy piece of iron, standing vertically, and to prevent the end upon which it rests from heating, it is placed in a deep step, in which are several smooth plates of steel, which distribute the friction by slowly revolving, one upon the other.—It occasionally occurs that these plates, when the lubricating material has been pressed from between them and become loose in the step, are found welded together so firmly that they cannot be separated even with a cold chisel.

A company has recently been established in Paris for the purpose of drilling, drawing and welding metals, a large part of whose operations are founded upon this principle of cold welding. Gun barrels are made by them, by drawing a succession of tubes one over the other, all having highly polished surfaces, by which process the barrel is made up of a homogeneous mass, cold-welded together, and forming a gun of great strength and exceeding lightness. The French government have ordered 50,000 rifle barrels made by this process.

Steel tubes may be made after this manner of almost any desirable length or size. Ten-inch guns, or even larger, may be thus made, vastly lighter and much stronger than any heretofore manufactured.

It is noticed as a singular fact that the temperature of the iron is scarcely raised to a sensible degree by the operation of drawing, provided the surfaces are perfectly smooth. But if the slightest scratch or abrasion occurs, the temperature is at once raised eighty or ninety degrees. This fact is looked upon as quite a phenomenon, inexplicable by any known laws, and suggestive of a new principle in the laws of heat. There are probably many uses yet undiscovered to which this principle may be applied, not the least of which is that already applied in the hooping of journals. The steel being perfectly homogeneous, and quite devoid of fibre, journals thus prepared, when in use in a good brass bearing, acquire a surface of surpassing smoothness, and revolve with so little friction as to be practicably indestructable.

Prof. Hofman of London has patented a process for making a new coloring matter by means of iodine extracted from seaweed, and which produces a beautiful violet, blue violet, or red violet. The patented process consists of mixing in certain proportions the substance called rosaniline with the iodides of ethyl, methyl, or amyl. This dye may be used in the same manner as the aniline colors, and is already in the hands of practical people in all the manufacturing districts, and bids fair to be the "color of the season."

Santa Cruz is getting to be one of the great manufacturing counties of the State—powder and paper mills, lime kilns, lumber mills and tanneries, are all at work there, and others still in contemplation.

A Whim of a New Pattern.—On the Ponce de Leon claim, in the northwest portion of Virginia City, according to the *Enterprise*, a little north of the new Ophir shaft, is to be seen a whim of a new style. This whim is the invention of Mr. John W. Wedlock, and is thought to be superior in some respects to the whims in common use. The drum revolves horizontally, and by means of small wheels on the shaft passing through its centre, is driven by a larger cog-wheel, on an upright iron shaft, to which the horse is attached by a lever. The horse travels one way round all the time, the change in the motion being effected by throwing the small wheels in or out of gear, they being on a sleeve, sliding on the shaft of the drum. There is also a brake attached to the drum, which is worked by a lever in precisely the same manner that the brake of steam-hoisting works is operated. The apparatus appears to work very well, though being the first machine of the kind ever erected here it is not perfect in every particular, but the fault in this can be remedied in the next one erected. The castings are rather light and there is so little room between the beams, above and below the drum, that the cable, sometimes—when it happens to ride by wrapping up unevenly—catches against the beams and stops the machine. This fault, however, is easily remedied. We understand that the inventor has taken steps to secure a patent. The cost of the apparatus, wood-work and all, is about $1,400. Another machine will be erected shortly on a claim in this vicinity.

A Railroad Across the Andes has been projected by Harry Meigs, formerly of this city, and now of Valparaiso, Chile. The project is a grand, and at the same time pronounced a feasible one. Its object is the connecting of the inland valleys of Chile with the immense plains of the Argentine Republic. The projected railroad would have an extension of only eighty-seven miles, an elevation of six thousand six hundred feet, would cost eight million dollars, and require four years to build it, offering no great difficulties to engineering. It ascends the valley of the river Teno, in Chile, and after crossing the mountains descends into that of the Rio Grande, one of the tributaries of the Rio Negro, which forms the frontier between the Argentine Republic and Patagonia. The report says that only two points require extraordinary works; one, a narrow gully of the river Teno, eleven miles long and only thirty feet broad, and the other a ravine, with an ascent of four hundred and fifty feet per mile, six miles long. Both these difficulties are not insuperable to modern engineering, and the great obstacle offered by the mountains between the Teno and the Rio Grande is avoided by the discovery of a new valley in the very heart of the Andes.

Mining Machinery.—We saw yesterday at the Marysville Foundry something new—at least new to us. It was what is called the Conveyor Screw, which, when boxed and put into its place in the mill it is designed for, will convey dry-crushed quartz from the battery to the amalgamating pans. The screw is 125 feet long, and is intended for the Silver State Reduction Works, at Empire City, N. T. Its cost is about $1,000. It is worth seeing, and we advise the curious to take a look at it before it is shipped. We cannot describe it without diagrams; but we can say it looks like a tremendous copperhead. While at the Foundry we also saw five or six tremendous bed plates for as many 60-horse power engines, which are being manufactured to fill Washoe orders. Two of these engines were for the Manhattan mill, and one for the Atchison mill, at Washoe City. A large number of hands are engaged at these works, in plodding at all the various branches—some moulding, cleaning castings, planing, boring, etc. The Marysville Foundry is a busy place about these days.—*Marysville Appeal.*

Sale of a Railroad.—The section of the Auburn railroad from Folsom to Auburn Station, a distance of twelve miles, was sold, on Saturday last, to satisfy a mortgage. The original claim was $183,566. It was bid in, for the mortgagees, for $75,000. The track is to be torn up immediately, and the iron and other material will be used to extend the Placerville and Sacramento Valley Railroad from Folsom to Latrobe, formerly Miller's Corral. A town has recently been laid out at that point, to which the Placerville road has been graded, and there, for some time, will be the easternmost station of the Placerville and Sacramento Valley Road.

Compromised.—The suit between the Baltimore American and the Oneoto Company, in Judge Atwill's Court, has been compromised without a trial, as it was shown that one of the parties litigant was laboring under an evident mistake.

Japanese Art.—In all the mechanical arts the Japanese have unquestionably achieved great excellence. In their porcelain, their bronzes, their silk fabrics, their lacquer, and their metallurgy generally, including works of exquisite art in design and execution, I have no hesitation in saying that they not only rival the best products of Europe, but can produce in each of these departments works we cannot imitate, or perhaps equal. It is quite true that Europe may also make a similar boast with justice. There is much, especially in art, so called, to which the Japanese cannot make the slightest pretensions. They cannot produce, by any effort, works to be compared with the noble specimens of Repousse carving, from the chisel of a Vechte, a Morel Ladeuil, or a Monti, which the great International Exhibition showed; yet the Japanese bronze castings are, some of them, scarcely inferior in skilled workmanship and mixture of metals to anything we can produce of the same kind. No Japanese can produce anything to be named in the same day with a work from the pencil of a Landseer, a Roberts, or a Stanfield, a Lewis, or Rosa Bonheur, whether in oil or water colors; indeed, they do not know the art of painting in oils at all, and are not great in landscape in any material. Their knowledge of perspective is too limited, and aerial effects have scarcely yet entered into conception. But in figures and animals, I have some studies in Indian ink, so graphic, so free in outline and true to nature, that our best artists might envy the unerring touch and pencil so plainly indicated. In the rendering of animals, whatever the material employed, they seem to have studied not only the mere forms, but the habits and character of each with such accuracy and closeness of observation, that they gain a perfect mastery over their subject, and by a few lines and dash of the brush produce a faultless imitation of nature. This is especially true of the stork, the emblem of longevity, and nearly as much admired by the Japanese as ever was its kindred ibis in Egypt. Hence, on porcelain, lacquer, in enamels, on ivory, in *basso relievos*, in steel and iron, in bronzes, it is everywhere to be met, and with a marvelous perfection of workmanship and artistic power.

Gold Yield of Australia.—A letter in the London *Star* from Melbourne, Australia, says the yield of gold for the year 1863 has not been quite equal to that of 1862. There is a deficiency in the total yield of 20,000 or 30,000 ounces, but the increase of machinery, and the improved processes for saving gold, promise better for the present year. The deep lodes of Ballarat still prove to be very rich. For an example, the Koh-i-noor Company lately washed out 459 ounces of gold in three days, and declared a dividend of £60 per share for ten days' work. During the year the total clearances of gold amounted to 1,985,501 ounces, of which 1,634,377 ounces were from Victoria, and 364,124 ounces were transhipped from New Zealand. The clearances during 1862 were 2,029,839 ounces—1,711,508 ounces being from Victoria, and 308,331 ounces from New Zealand.

Genesee Valley.—The Quincy *Union* says that the Genesee portion of Plumas county is full of life and excitement. A new town has been laid out near the mouth of Grizzly Creek, and a saw mill, boarding house, and several other buildings are in process of construction. Laufman & Co. will have their Copper Smelting Works in operation during the month of July. All of the surface claims on Grizzly and Genesee creeks are paying well. "Feet" in the copper ledges have advanced considerably in price during the past two weeks, and quite a number of feet have been purchased during that time by San Francisco capitalists. The same paper says the Crescent Mill, in Indian Valley, for a run of eight days, cleaned up over $9,000. A few more such runs as that and the Company will be prepared to declare another $50 dividend.

A New Mint for San Francisco.—The telegraph announced, on Wednesday, that the bill appropriating $300,000 for the erection of a Branch Mint in this city, passed the Senate on the day previous.—The site selected is the western half of the Custom House block.

The Kings River Mines.—The Visalia *Delta* speaks encouragingly of the placer mines of that region, particularly of the Sheba diggings, where there are about twenty sluices at work, and many getting ready; are making from $1 to $17 to the man. The extent and richness of the mines are but little known; water will hold out a month or more longer.

The American copper-toe shoe has been introduced into use in England.

Patent Department.

The Bartola Patent.—Mr. Bartola, to whose process for working sulphurets we referred at length last week, has recently taken out a patent for "An Apparatus for Concentrating Ores" (probably sulphurets). We have no further description of this apparatus than the following:

I claim the movable grating or gratings, d, applied to the inclined plane or trough of ore-concentrating apparatus for the purposes and substantially as specified.

I also claim the bars or slats, 1, 1, formed deeper at the lower end of the grating than at the upper, for the purposes and as specified.

Improvement in Stamp Shoes.—The Esmeralda *Union* says that Mr. G. W. Coffee, of the Union Foundry, at Aurora, has made applications for a patent for an important improvement in the casting of stamp shoes, which is made by first casting a very small shoe, which, after it is cold, is set up inside of a cast iron chill, or mould, and the large shoe cast around it. The advantage of this method is that the metal cools both from the inside and outside, leaving no chance for the hot metal inside to shrink and crack after the outside is cold. Another advantage is that the iron after cooling is left much harder than when cast in the ordinary way. We are informed that some shoes cast on the above plan in the Union Foundry have been running steadily for ten weeks in the Bodie mill, whereas the average duration of shoes cast on the old plan is about five weeks.

A New Sawing Machine.—A late Montreal paper speaks as follows of a new sawing apparatus, which the inventor calls the "Locomotive Cross-cut Sawing Machine:"—"It is intended for cutting cord-wood and all kinds of horizontal and cross-cut sawing. On seeing it work, we came to the conclusion that its effectiveness in operation was only equalled by the simplicity of its construction. The machine consists of a frame two feet wide by six feet long, upon which is mounted a large wooden pulley or multiplying wheel, forty inches in diameter, a band from which passes over a pulley, upon the axis of which is placed a fly-wheel. In this manner motion is given to a crank which gives the saw a horizontal movement in any position; the rollers being capable of being raised and depressed as required. Two saws can be attached to the machine, if necessary, and it can easily be worked by boys, while two men by its aid could cut a cord of wood in an hour. The machine is a Canadian invention, being patented in Canada, June 9th, 1863. A patent has also been taken out at Washington."

Head Rest.—Mr. Ephraim Hambujer, of Detroit, Michigan, has received a patent for a head rest for use in railway-carriages. The invention consists in a self-fastening spring clamp capable of being attached instantaneously to the back of a car seat or any other similar article, and provided with a stationary and with an adjustable socket, in combination with a vertically adjustable pad, in such a manner that by fastening the clamp to the back of a chair or seat of any other description, and inserting the pad in either one of the sockets, the pad or head-rest can be readily accommodated to the desired position and to the stature or size of the occupant of said seat, and a convenient and comfortable rest for the head is obtained.

An improvement for protecting engraved plates has been introduced in France by Chardon, which invention consists in covering the plate with a very thin layer of iron, by means of the galvanoplastic process. The deposit is so fine that the finest lines of the engraving are found to be exactly copied. When the thin iron stratum becomes worn, it can be replaced by plunging the plate in an acid which will dissolve the iron without attacking the copper; and thus the plates may continue to be used for an indefinite period.

Brush for Cleaning Boilers.—G. P. Leonard and William Lauster, of Fall River, Mass., have patented an apparatus for cleaning boiler flues, which consists in a brush made of flat pieces of wire or narrow strips of thin metal, which are passed through a stem formed by doubling up a piece of wire or strip of sheet metal and fastened by a thin round wire wound round the same in such a manner that by said binding wire a hollow stem is formed, and after the whole has been secured together and twisted, a handle can be introduced into one end of said tubular stem, and the brush is ready for use.

Water Elevator.—The Alpine *Chronicle gives* the following description of a novel water elevator now in use at Diamond Hill, on the East Fork of Carson river, and employed to draw water from that river:—"A half-inch wire 180 feet in length is set on posts running from the road down to the river, at an angle of thirty-five degrees. At the upper end is a wheel, two feet in diameter, with a crank; to the cord on the wheel is attached the car, a board one foot in length and eight inches wide, which is connected to the wire by two sheaves. When you wish to draw water, you hang the pail on the car by a spring hook, starting the same down the wire to the river; the pail fills itself without any trouble. By turning the wheel the car with its load comes up so easily that a child could raise it. It is called the Railroad and Telegraph Water Raiser."

The Iron Foundry at Aurora, Esmeralda, appears to be in a flourishing condition. The proprietor, Mr. Coffee, says that he can melt iron in Aurora in less time and with ten per cent. less coal than in any other place he ever worked. This is probably owing to the rareness of the atmosphere, as for the same reason, water can be boiled at this altitude with several degrees less heat than is necessary at ocean level.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

The Mining and Scientific Press Patent Agency.

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent? A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the columns of the Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by conducting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail.—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and allidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This new applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appelant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed. We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

SILVER MINES IN CALIFORNIA.

The idea which, until recently, was prevalent that paying silver mines will never be found on this side of the Sierra, is fast being dissipated. Recent developments in Calaveras, Amador and Tuolumne counties appear to have quite effectively settled the question. We have never seen any reason assigned why silver might not he found on the western as well as the eastern slope, other than the simple fact that gold has constituted, for years, the only precious metal which has been found, to any extent, on this side. The fact that much of our gold is strongly alloyed with silver, appears to have been entirely overlooked. Much of the gold taken out in Calaveras county assays as low as twelve and fourteen dollars an ounce, owing to the large quantity of silver which it contains, and generally, the higher up in the mountains of Amador, Calaveras and Tuolumne, the gold is taken out, the larger is the percentage of silver returned. The mines of the Blue mountains yield a large percentage of silver. Silver is also found in the upper portions of Plumas, particularly in the vicinity of the copper mines. We have seen splendid specimens of copper from that region, carrying native silver in connection with the copper.

We last week alluded to an interesting discovery of silver in the Oriental copper mine, Amador county, the concentrated sulphurets from which yielded $1,756 in silver, and $240 in gold. We have since received a letter from Rev. I. B. Fish, one of the proprietors of this mine, in relation to this strike, which reads as follows:—"I find in our mine—south drift, 140 feet from surface—a solid vein of silver rock, such as I showed you, four inches thick, and then silver sulphurets, thickly diffused through three or four feet of quartz gangue; all underlying a lode of yellow copper ore, averaging one foot thick. The silver at present predominates. We shall soon test two or three tons of the silver ore."

We were shown, a few days since, some beautiful specimens of native silver from the mine of the Salt Spring Valley Co., located three miles north of Copperopolis. Our traveling correspondent, as long ago as last December, writing of this mine, said:—"If in so essentially a copper formation as this district is, it is possible for a silver lode to exist, this must be one." A lot of rock from this mine was sent to this city about that time and tested for silver; that metal was found, but not in paying quantity. Work, however, has been continued, and of late, with most gratifying success. They have recently had another crushing, with what precise results we do not know; but quite sufficient to raise the expectations of the company to a higher pitch than ever.

Native copper, containing native silver, is also found in the New Era Copper Mining Company's claim, on Don Pedro's Bar, in Tuolumne county, fine specimens of which have been exhibited in this office.

INSURANCE DEPOSIT.—The branch office of the Phœnix Insurance Company, of Hartford, Conn., has deposited the sum of $75,000, in compliance with the provisions of the Amendatory Act regulating insurance companies in this State. This is one of the oldest and best established insurance offices in the country. Office in this city, 603 Commercial street.

MINING SHARE MARKET.

The Mining Share Market is suffering a season of most unusual depression. Even stocks whose intrinsic merits are beyond question have been seriously affected by the prevailing apathy. But few stocks are sought after or offered, and those that are heard from are chiefly of low price. This condition of things is attributable to a variety of causes already well known. The panic will undoubtedly be but temporary, and we may soon look for a reaction. Prices have probably already reached their lowest limit.

The principle transactions of the week have been confined to the Chollar, Real del Monte, North Potosi, and Lady Bryan. Chollar has been largely dealt in at an important advance, based upon highly favorable reports from the mine. Ophir is also beginning to show some evidences of improvement; North American has been well maintained; North Potosi has been active but at fluctuating rates. Pride of the West has met a most important decline, for reasons elsewhere given.

We would refer readers to our tabulated statement of the business of the week and to our editorial columns for much of interest in relation to stocks and mining matters generally.

THE IDAHO MINING MANIA, like all which have preceded it, is destined to prove another gull trap to catch a large portion of the foolish adventurers who run after everything in the way of mining excitement. Thousands of people who have left comfortable quarters with merely enough money to reach that distant region, will soon find themselves destitute and in want, with no prospects ahead but charity or starvation. Idaho will soon present just such another scene as Fraser river did a few years ago. Like all other mineral districts, it without doubt has its rich veins of quartz and rich placers; but they are not to be found on every hill-side or in every gulch. As well might all California go crazy and rush to Grass Valley because two or three rich strikes have recently been made there. We have talked and written warnings against every mining excitement since the rush to Gold Lake, in 1850. Scores of others have done the same, but all to no purpose. These excitements are periodical and inevitable. They are usually started and fostered by heartless speculators, and always find plenty of dupes, who are anxious to part with their money in an eager chase for some supposed El Dorado, no matter where, if it is only a little way beyond any given region of known value.

THE AMERICAN FLAT MINES still continue to occupy a large share of attention. The EXPRESS COMPANY are taking out some very fine rock. Their shaft is now down 130 feet, the last 60 of which have been driven through quartz filled with sulphurets, and bearing a strong resemblance to the Imperial rock, of Gold Hill. They are expecting to strike pay rock soon.

THE ROCK ISLAND is one of the oldest locations on American Flat. The first work upon this mine was done in 1860; but owing to financial embarrassments but little was accomplished until the more recent developments on the Flat, the past season. They have now two tunnels, one in 500 feet and another shorter one. A shaft is under way which will strike the shorter tunnel at a depth of 270 feet. The mine discharges a large quantity of water, some 70 inches now running from the 500-foot tunnel. This tunnel has already been pushed some 60 feet into a ledge of quartz, which is thought to be 100 feet thick. Of the quality of the ore we are not advised, further than it resembles that taken from the Holmes mine, Gold Hill.

THE butter dealers in New York recently combined, and raised the price of butter to fifty-three cents a pound. In Boston it has been as high as sixty-five cents.

WASHOE STOCK MARKET.

Review of the Week Ending May 9th, 1864.

The period under present review has been even more dull than any which has preceeded it, while the sales have been exceedingly small and insignificant. But few stocks have been sought after or offered. The "bids" and "asks" have been wide apart, and have afforded very little evidence of the actual value of the stocks presented. The following are the transactions of the week:—

Twenty shares of Arizona from $7½@9; Atlantic, 15 at 3½.

Birdsall, 5 at $6; Consolidated Brotherhood, 15 at 75 cents; Combined Effort, 5 at 4½; Colorado, 10 at 4, and 10 at 4⅛; Diligent, 5 at $1; Golden Swan 10 at $6.

Harold and Argo has been more dealt in than any other stock, at prices ranging from $4@7¾, closing at $7; 242 shares have changed hands since our last report.

Jewett & Sheppard opened at $27 and gradually advanced to $30, Monday, but declined the next day to $27¾; 60 shares have changed hands. Judge Advocate has met with a single purchaser at $1.

King Solomon opened at $1¾ and closed at $1¼, sixty shares having changed hands. Kentucky found a single purchaser of 9 shares at $4½.

Knickerbocker has sold at from $32½@34½, closing at the former figure; 27 shares Kossuth sold at $8¾.

Leopold is quoted at from $7@7½; Lafayette, 20 shares at $8.

Nine shares Moray sold for $4; Mother Lumpkins has sold from $1¾@2, eighty shares having changed hands.

New Orleans, 30 shares changed hands at from $1@1¼; Naragansett, 100 at 50c.; North Whitman ,10 at 50c.

Pony Express opened at $4 and advanced to $7, with sales of 70 shares; 10 shares Platt & King at 75c.

Randolph has met with considerable business at fluctuating rates, 120 shares having changed hands at from $7½@9.

Rock Island has been quite uniform, sales of 49 shares having been made at from $29@30½; 25 shares of Randolph sold at $8: 75 Rich at 50 cents.

Thirty-five State of Maine sold at 50 cents; 5 of Sutro at 4; 15 shares of Yuba sold at $2¾ and 30 at $3; seven of Sante Fe at $8; ten of Spring Valley at $7; six West Point at 50 cents; 25 San Francisco at 7½.

A SUBMARINE BOAT has been built at La Rochelle. She carries a spur at her bow which is formed like a tube, and an incendiary shell may be placed in it. Should the enemy's fleet be at anchor, the Plongeur will drive her spur into the nearest ship, then retreat, unrolling a metallic wire. When at a safe distance an electric shock will cause a great explosion, the enemy's ship being blown up.

PIONEER STOCK BOARD, REESE RIVER.—The Reese River *Reveille* gives the following as the proceedings of the Pioneer Stock and Exchange Board at their meeting on Monday, the 2d inst:

REESE RIVER DISTRICT.—Maggie, $75 bid, $75 asked; Marion, 10 asked; Smith & Martin, 7½ asked.

AMADOR DISTRICT.—Chapman, 5 asked; Rough & Ready, fifty asked; Wildwood Tunnel Company, 5 asked.

SMOKY VALLEY DISTRICT.—Mountain Company, 10 asked.

BUNKER HILL DISTRICT.—Brown, 15 asked; Real del Monte, 15 asked.

MISCELLANEOUS CALL.—Isabella, fifty asked; Stephen A. Douglas, 8 asked; McMannis, 10 asked; Oregon Mill and Mining Company, 1000 asked; Murphy, 4 asked; Cox and Rose, 5 asked; Black Ledge, 5 bid; Amador, 150 asked; Sinaloa, 3 asked; Washington 4 bid; Joe Lane, 5 bid, 10 asked; Fox and Robinson, 1 asked; Wm. B. Astor, 4 asked; Ethan Allen, 20 asked; Mammoth Tunnel Company, 4 asked; Oseeola, 7 bid, 15 asked; Hidalgo, 5 asked, Daeota, 6 asked; Warner and Wells, seventeen and a-half asked; Lapine Tunnel Co., 5 asked; Byron, 25 asked; Fort Sumter 8 bid, 13 asked; Scotia, 3 bid; Coral 30 asked.

SALES.—Five feet of Maggie at $75 per foot.

Mining Gossip.

EDITED BY.....FRANK WARDDELL.
FOR THE MINING AND SCIENTIFIC PRESS.

Mysterious Feature of the Week.—One of the leading and really the most mysterious features of the week, has been the sudden and great depreciation in the Pride of the West stock, which, many say, is attributable to the neglect of some of the officers who have charge of the financial affairs of the company at the mine, in communicate to the officers in San Francisco. This neglect is, to say the least, condemnatory, and should not once be enquired into. If any fault is attributable to any one of the said officers, his removal should be strenuously urged. This silence on the part of the officers has caused many heavy losses; many holders of the stock having sold at greatly reduced prices in consequence of the uncertainty as to the condition of the mine. We have enquired at the office of the Secretary, and find that officer about as much in the dark as the stockholders. He remarked to us that he had telegraphed and written, but all to no purpose. We recommend a meeting of the Trustees of this company without delay. Let them take such action as will enable stockholders in future to obtain all information which may concern their interests. It is about time that these *exceedingly curious doings* in mining companies should be done away with, and affairs conducted more on the "square."

Lively Times.—We learn that the selling and buying of "feet" has become all the rage in New York City. They have two boards under full headway, and the people take as lively an interest in "feet" there as we do here. Stocks of all descriptions are commanding fair market rates, and the "bulling and bearing" system is also brought into active play. How long this new species of speculation will continue, it is difficult to tell; but we suppose, like everything else, the market, in the course of a few months, will be completely loaded with worthless stocks, and then a general collapse and wind up will ensue. Stand from under, gentlemen, when the crash comes.

Important Mining Suit.—In the Twelfth District Court, on the 10th inst., the Commercial Mining Company brings a suit against Chester Gillespie, to obtain a division of certain property. It seems there are nineteen thousand two hundred feet of mining ground, situated on Santa Catalina Island, owned by the parties, of which the defendent owns one-sixteenth. The said parties do not agree upon the mode of working and administering the business affairs of said mining claims, and the defendent refuses to pay his proportion of the expenses. The plaintiff therefore asks for a judgment partitioning said property between plaintiff and defendent.

The Chollar Company.—A large number of sales have taken place in this stock during the past week, and in most cases at advanced market figures. It is reported that a well defined lead of rich ore has been discovered; many are also under the impression that a modification of the recent decision will permit the company to re-open their lawsuit against the Potosi. The manner in which this once sadly-depressed stock is gradually advancing must be a great consolation to those owners who are still holding at the old high rates.

Something Like.—Mr. John D. Winters, a gentleman well known in the community as having obtained a large fortune from mining operations, advertises for sealed proposals, for the erection of a private residence, near San Jose, to cost $80,000. He is what may be termed a lucky Washoeite indeed, and furthermore, we should judge from appearances that he intends to have the comforts of this life, at all events.

Taxes.—The taxes in Tuolumne county amount to $3 81 on $100. The total County tax is $2 56.

Greenbacks.—A large quantity of greenbacks have changed hands, both at public and private sale, during the week, at fluctuating rates.

Injunction.—The Gould & Curry Company commenced an injunction suit against the Potosi Company, and obtained a restraining order until the 14th inst.

Bullion.—The amount of bullion shipped from Aurora from the 1st of January to the 1st of May was $428,300.

Gould & Curry.—This stock has fallen, much to the astonishment of our brokers. There is no cause for it whatever, aside from the general depression of the stock market.

Mass Meeting.—A mass meeting was held at Virginia City on the 10th inst, for the purpose of expressing the views of the people respecting the tax to be levied upon the income of mines.

Rich Rock.—Very rich rock has been discovered in the Nonpareil mine, situated at Big Oak Flat, in Tuolumne county. The rock is said to equal in richness any ever taken out of a mine in California.

Dividend.—The Trustees of the Eureka Gold Mining Company have declared a dividend of 1½ per cent. on the capital stock of the Company, which was payable on Thursday, May 12th.

Improvement.—The Hale & Norcross Company are putting up a new building over its mining works. The frame is nearly all put together, and is seventy feet long by forty wide. It will make a fine appearance when completed.

Powder Works.—The California Powder Works, located at Santa Cruz, have commenced operations. They intend only to manufacture blasting powder at present, and they estimate that they can easily turn out five thousand pounds per day.

Truthful.—"A smooth sea never made a skillful mariner;" neither do uninterrupted successes qualify a man for usefulness or happiness. The storms of adversity, like the storms of the sea, arouse the faculties, and incite the invention, prudence, skill and fortitude of the voyager.

On the Buy.—Several parties are on the way here from the East, with the intention of purchasing mines and incorporating the same under their respective laws at home, and disposing of the stock there. They represent some wealthy houses.

Improving Slowly.—Mr. W. P. Denekla, President of the Pacific Board of Brokers, we regret to say, is improving rather slowly. He had a relapse on the evening of the 8th inst. We were in hopes to have seen him among the busy throng long ere this.

A Dull Week.—The past week has been a very dull one; little or no animation having exhibited itself in stocks. It is to be hoped that a change, and that for the best, will soon take place, Brokers, keep up your pluck, for the old adage says "that it is always darkest just before day."

Departure.—Mr. T. J. Williams took his departure on the steamer J. L. Stephens, on the 10th inst. Mr. Williams is superintendent of the Otate silver mine, situated in Sonora, Mexico. He takes with him a large quantity of machinery, and, in fact, every requisite to thoroughly work this mine. He is an energetic young man, and well posted as to his duties as superintendent.

Appointment.—Mr. Henry F. Parain, a young gentleman well known to the mercantile community of this city, has received the appointment of Assistant Superintendent of the Sweet Vengeance G. & S. mine. We are given to understand that this company are hard at work developing their lead, and have now over fifty hands employed. Mr. Parain has had much experience in mining matters, and a better selection could not easily have been made.

The Amazon Tunnel and Mining Co.—We have received the first quarterly report of the officers of this Company, from which it appears that the total amount of stock issued is 1,690 shares, leaving unissued 310 shares. Three assessments have been levied, from which $2,410 have been realized. With this money a tunnel has been run 111 feet, 96 feet of which has been through hard granite. They have a good track and car, and a general assortment of mining implements. The expenses of incorporating, printing, surveying, recording, etc., have also been paid out of the amount received. The superintendent thinks he is close upon the ledge. The affairs of the Company are prosperous and encouraging.—Reports of this character should be made by every incorporated company. It is due the shareholders that they should thus be informed of the prospects and progress of the Company in their work of development. The cost of such reports is trifling compared to the benefits to be derived therefrom. No company should hold a standing in the market that neglects to take proper measures to make known to its stockholders, at stated intervals, its financial condition.

Stocks in New York.—A correspondent writing from New York, remarks respecting the condition of the stock market, and more especially on the 9th of April, when the Legislature had all the bills "killed" whose objects were for running Broadway railroads. In fact the correspondent states that during the past week the stock market was crazy, and goes on to say that Fort Wayne, Harlem, Reading, and so on, bounced up and down in such a manner that fortunes were made and lost in an hour sometimes. Ten, fifteen, twenty per cent. some stocks rose and fell in a day! This created such an excitement that outside speculators rushed in by hundreds, and even women partook of the general feelings. They handed all the money they could scrape together to their brokers, as a "margin," and "went in" for the favorite stocks. The scene in Wall street, all day, beggared description, as "flush" men invested and came out bankrupt, or poor devils dipped in for luck and came out "cat-bird." At night the game was continued at the "Evening Exchange," under the Fifth Avenue Hotel; and so they kept it up "from night till morn, from morn till dewy eve." All sorts of bumbug gold and silver mining companies' stocks are the "card" in the market, and goodness only knows when the madness will end.

The State Geological Survey.—Professor Whitney, of the State Geological Survey, left, with his family, in the Golden Age, yesterday, for New York. The Professor goes East for the purpose of publishing the first three volumes of his Report. There will be matter for five volumes more at the expiration of two years. Professor Brewer, Mr. Hoffmann, and Mr. King, of the Geological Survey, are to start, next week, for the unexplored region in the Sierra Nevada, between Walker's Pass and the Moun trail, where they will continue their examinations and explorations.

Accidents.—John McGrath had one of his legs broken, a few days since, by a cave in a cut in which he was working, in claims at Morristown, Sierra county. Also, David Upham was seriously injured by a cave in the Oro quartz claim, at Downieville.—Isaac Davis was injured badly by the premature explosion of a blast at the Young America mine, Aurora.

Eastern Capital.—Scarcely a steamer arrives from the East that does not bring one or more Eastern capitalists, seeking investments in our mines. Having amassed fortunes in greenbacks, they seek in California and the adjoining Territory opportunities for turning them to profitable account. As a general thing they prefer developed and dividend-paying investments.

In Colorado.—The head clerk of Duncan, Sherman & Co. was recently at the Colorado mines, taking notes. According to the Colorado *Mining Journal*, he expressed himself as highly gratified with the prospects of the mines of that region.

[Written for the Mining and Scientific Press.]

Reese River Correspondence.

Messrs. Editors :—The Mills, Post & White Consolidation have a shaft about thirty feet in depth, and a tunnel advanced to a short distance on their claim. Their ledge proper is about one foot wide. The tunnel was started in search of blind ledges, and would have struck some of the best on Austin Hill had work on it not been discontinued a little too soon. The Black Swan ledge runs parallel with the Mills & Post, and about fifty feet below. This Company is not at work on account of an injunction laid on the claim at the instance of the Mills & Post Company, on the ground that the Swan is within one hundred feet of the former. The district mining laws grant one hundred feet on each side of a ledge, but that grant has always been understood heretofore to be solely for working purposes. A jury of miners will most assuredly never render a verdict otherwise. There are hundreds of other ledges in this district in exactly the same fix as the Swan, but a decision in this case appears to have been carefully avoided by the injunctors. The shaft on the Swan ledge is about forty feet down, and the ledge one and one-half feet wide at the bottom. Much rich rock has been taken out of the ledge while the incline was being sunk. The locator, who named the claim, and who is a native of the Old Dominion, indignantly denies the imputation that the ledge was named after the contraband Jenny Lind ; he says it was named after the Black Swan of Esmeralda, which was named after a pretty young white girl, of San Andreas.

The Bombay ledge has a shaft about fifty feet deep, and a lot of fine rock near its mouth. It should be worked. The incline on the Belle Shields is now being advanced, with fair indications of a medium ledge. The shaft is down thirty-five feet. There is no work being done on the Bamboo, Real Del Monte, Clery, Blake, Post Hole, or Sada Redfearn, and many other ledges less known. There are hundreds of such ledges jumpable, though it is not likely any one will take that trouble. The Tesoro Company, in Marshall Cañon, are sinking two shafts, one of which is down about seventy feet and one forty feet. The width of the ledge is about three feet. The Union No. 2, in the same Cañon, is a fine claim, though for some cause or other not being worked at present. On Austin Hill, the Kelly ledge is thirty feet down, with a ledge two feet wide. The Rosina ledge has a tunnel advanced to a short distance. The Roanoke Company is running a tunnel, from which they have a shaft on a ledge one foot wide. The Manhattan is also running a tunnel. At the dividing line between the Emma and Anna Funston, a shaft is being sunk. The ledge is here only one foot wide, though the claims are considered good, being in the vicinity of the Oregon. The Ethan Allen has a shaft of fifty feet, and a ledge between one and two feet in width. The Illinois, Magnolia, and other Companies also in the vicinity of the North Star, Oregon, and Morgan & Muncey, are prosecuting the work.

The Stranger ledge lies on the flat between Oregon and Lander Hills. There is an incline on it to the depth of sixty feet, and the ledge is one foot wide. At a forced sale of its stock for assessments a few days ago, it brought $7 per foot. The Smith & Martin ledge lies on Lander Hill. The ledge is one foot wide, and the rock near the surface very rich. They are working this ledge by stripping it and taking out the surface rock. In this way it more than pays for the expense of working the claim. There is a shaft on the ledge to the depth of thirty-five feet. The Samantha ledge, on the same hill, has a shaft seventy-five feet down, and a ledge one foot wide. On the other side of the hill, the Pinchout Company are sinking an incline, already sixty feet down, on a ledge two inches wide. These boys have the genuine miner's pluck in them, and are bound to find out whether they have a bona fide ledge or not. This can scarcely be determined in this neighborhood until an incline has been sunk to a depth of more than 100 feet. The Tippecanoe is fifty feet down, with a ledge fifteen inches in width.

EMIGRANT CANON.

The Sonoma ledge Company, and the South Sonoma, which is the first South extension of the original Sonoma, are running a tunnel near the dividing line of the two Companies. This tunnel, which is a very nice piece of work, has been advanced through the solid rock to the distance of 230 feet, and has about 100 feet more to be extended before it will strike the ledge. The Sonoma ledge, which is about three feet in width, is at the surface a conglomerate mass of decomposed quartz, filled with chlorides, with streaks of granite running through the ledge. One of the richest specimens ever found in the Reese River region was taken out of this ledge near the surface. The ledge is encased in granite, but appears well defined. The Toronto, located further down in this Cañon, has a ledge three feet wide, at a depth, only, of thirty feet from the surface. The ledge rock, which is hard and similar to the Oregon rock, will work several hundred dollars to the ton.

Crossing the hill which separates the Emigrant Cañon from what is usually known as the Old Emigrant Road, we cannot help noticing a change in the float or outcropping rock on the side of the hill. It no longer presents the decomposed appearance universally met with on Lauder Hill, but assumes the character of hard quartz. The Ontario's old shaft having caved in late last Fall, a new shaft was commenced during the Winter, and has been let down to the distance of 101 feet. This shaft, which is an oblong one, 9½ by 5 feet, is well timbered and one of the finest pieces of work of the kind in this Territory. The ledge, which is three feet wide, has not yet been reached. Operations on the shaft are temporarily suspended on account of water. The South extension of the Ontario is termed the You Bet. They are now at work on it.

YANKEE BLADE SECTION.

To reach this section we have a very steep hill or mountain to climb. Having reached the summit we meet with large masses of rock, cropping out on the side of the hill. This rock is of a bastard character, being neither slate nor granite, but an intimate composition of the two. The shafts of the Yankee Blade Mining Company (the original location) and the Whitlatch Yankee Blade, lie side by side. Work has been resumed on the Yankee Blade, a contract having been let for the sinking of a perpendicular shaft of 140 feet. This shaft is to be an oblong one, eight by four feet. The claim contains 1,400 feet. The Whitlatch Yankee Blade has a ledge three feet in width, with a shaft upon it sixty feet in depth. A considerable portion of the ledge has been stripped, and the rock looks exceedingly rich. The Whitlatch Company claims only 600 feet. Why there should be such a marked difference in the prices of the stock of the two Companies is to me incomprehensible, except it is caused by the size of the Companies' locations. The Yankee Blade ledge will undoubtedly re-establish and, this time, maintain the favorable character it enjoyed last summer.

Close by the Yankee Blade, and running towards it at an angle of about forty five degrees, is the Cicero. Its shaft is full of water; its ledge one foot wide. The Butte ledge lies above the Whitlatch Yankee Blade. This Company has a ledge one foot in width, and has advanced a tunnel sixty feet toward it. Lower down the ravine is the Paul Jones Ledge & Tunnel Company. Their tunnel has already struck a small ledge, but they have gone on in search of a larger one. We were unable to visit the Vineyard, it not being on the route laid down on our day's programme.

The village of Yankee Blade contains about thirty cabins and several families. About three fourths of a mile from Yankee Blade is the now noted "Maggie." A tunnel of fifty feet struck the ledge, and the Company has descended upon it on an incline run from the tunnel to the depth of twenty-five feet. Water comes in very fast at the present depth ; the ledge is about 2½ feet wide, well defined, and contains rock equal in richness to that recently obtained from the Oregon, North Star and the Isabella. Ruby and native silver are distinctly visible to the naked eye, and the rock is filled with the richest chlorides. This is the richest ledge in Reese River District at the same depth, and it appears to be located between the granite and slate formations. The gate of the Yankee Blade Tunnel Company is locked. This tunnel has been advanced a considerable distance, but has not yet struck a ledge sufficiently large to justify the Company to "incline" upon it. The Colossal has not yet commenced operations. X.

Austin, N. T., April 23d, 1864.

Mosquito Quartz Mining Company. Localton, Mosquito Gulch, near Mokelumne Hill, Calaveras County.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of May, 1864, an Assessment $5 per share was levied upon the Capital Stock of said Company payable immediately in United States Gold or Silver Coin, to the Secretary, at the Office of the Company, No. 433 Montgomery St., San Francisco.

Any stock upon which said Assessment shall remain unpaid on SATURDAY, the 11th day of June, 1864 will be advertised on that day, as delinquent, and unless payment shall be made before, will be sold on FRIDAY, the 1st day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees.

EM. FENARD, Secretary.

20-4t Office, 433 Montgomery Street, San Francisco.

Mount Vernon Gold and Silver Mining Company, Smoky Valley Mining District, Lander County, Nevada Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 7th day of May, 1864, an assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable immediately, to the Secretary of the Company, in U. S. Gold Coin.

Any Stock upon which said assessment shall remain unpaid on SATURDAY, the 11th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 25th day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale By order of the Board of Trustees.

WM. H. DUDLEY, Secretary.

20-4t Office, No. 523 Montgomery St., San Francisco.

Rose Linda Mining & Manufacturing Company, Mokelumne Mining District, Amador County, Cal.—Notice is hereby given that at a meeting of the Trustees of the above Company, held on the 11th day of April, 1864, an assessment of Fifty (50) cents per share was levied upon the Capital Stock of said Company, payable in Gold and Silver coin on the 11th day of May next, to the Secretary, at the Office of the Company, 509 Clay St., Room No. 2.

Any Stock upon which said assessment shall remain unpaid on the 11th day of May next, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 26th day of May 1864, at the Office of the Company 509 Clay St., to pay the delinquent assessment, together with the costs of advertising and expenses of sale. HENRY HALE, Sec'y.

San Francisco, April 11th, 1864, 16-4t

By order of the Board of Trustees the time for the payment of the above assessment has been extended ten days, on expiration of which time, 21st of May, the Delinquent list will be published.

HENRY HALE, Secretary.

San Francisco, May 10th, 1864. 20-td

Zenith Gold and Silver Mining Company, Mountain Ranch District, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 3d day of May, 1864, an Assessment, No. 5, of fifty cents per share, was levied upon the Capital Stock of said Company, payable immediately in United States gold coin to the Secretary at the office of the Company.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 4th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 18th day of June, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

Office, 645 Clay street, S. F. 19-4t

Peacock Gold and Silver Mining Company, Reese River District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of April, 1864, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. Gold Coin, to the Secretary or to Charles H. Fiske, Austin, N. T.

Any stock upon which said assessment shall remain unpaid on the 4th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 23d day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. C. W. M. SMITH, Sec'y.

Summary of Mining News.

A GREAT INDUSTRIAL FAIR!

—TO BE—

Opened in San Francisco,

—ON—

THE 30TH OF AUGUST, 1864.

THE MECHANICS' INSTITUTE OF SAN FRANCISCO ARE preparing for an Exhibition of Arts, Inventions, Manufactures of industry in general, upon a scale more grand, attractive and useful than ever before seen upon the Pacific Coast. Their Pavilion, built for the purpose, will occupy one of the city plazas, and will contain every convenience and appliance for an effective display. The Institute appeals to all persons within the scope of its influence, who are engaged in different branches of industry and art, to prepare and forward for Exhibition such articles as they may invent, discover, or make, that are useful, instructive, curious, or suggestive. There is scarcely an occupation in life that cannot supply some article that can be so considered, and by their public exhibition they may start the genius of invention in some other branch of industry or skill, the successful development of which may greatly enrich the State. The premiums and published reports of the Exhibition will widely advertise their qualities and merits.

Each age and country has new wants, which the progress of civilization creates and ingenuity gratifies. Those of our own day and section are improved methods and machinery for reducing ores of the precious metals. A striking feature of the Exhibition will be the number and variety of these, worked by the inventors. It is hoped that information most useful to the mining interest will be elicited. Miners are invited to send ores for exhibition, and trial, in quantities sufficient to be worked seperately in the different machines, in order to test both the relative merits of the machines and the value of the respective metallic veins.

The various transportation companies of the Pacific states and territories will, with commendable liberality, transport all articles intended exclusively for exhibition, free of charge, and Wells, Fargo & Co., in like manner, will take charge of them.

All articles forwarded should be labeled—"For the Industrial Fair," and be directed to C. B. Porter, agent.

Regulations for the Exhibition.

1—Persons intending to take part in the Exhibition are requested to make known their intention at the earliest practicable period, stating the kind of article or articles they intend to exhibit, and the probable amount of space required therefor.

2—The Pavilion will be open for the reception of articles for exhibition on Monday, the 22d day of August, and will continue open for that purpose until Monday, the 29th. The Exhibition will open to the public on Tuesday, the 30th day of August.

3—The name of every article should be attached to it; also a description pointing out its merits, when thought desirable by the exhibitor.

4—When articles are entered, a check for the same will be given, which must be presented and surrendered when the articles are withdrawn.

5—Articles intended for sale will be labelled accordingly, but cannot be removed until the close of the Exhibition, except by the written permission of the President.

6—Light, fancy or perishable articles will be received, or may be removed, at any time during the Exhibition, with the consent of the President.

7—All articles deposited will be at the risk of the owners, who are invited to be present during the hours of Exhibition. In the intervals efficient measures will be taken for the protection of property.

8—On the day following the opening of the Exhibition, each class of exhibitors will meet to choose, by ballot, their own Committees of Award; failing in this for one week, Judges will be appointed by the Executive Committee. The Executive Committee will award premiums for such articles as the several judges shall decide to be worthy of the same. The premiums will be delivered as soon as they can be prepared.

9—The morning of each day, until 9 o'clock, will be appropriated to the judges, and visitors will not be admitted during that time.

10—In case of misunderstanding, application may be made to the Executive Committee, who will be at all times in attendance.

11—Steam power will be provided, that machinery of all kinds may be seen in operation; and every possible facility will be given to exhibit all working machinery to the best advantage.

12—Exhibitors or their agents will receive free tickets of admission when, in the opinion of the President, the articles exhibited by them have such value, interest, or merit as to deserve it; but the transfer of any such tickets will work a forfeit of the privileges conferred by them.

13—All communications to be addressed to H. D. DUNN, Corresponding Secretary.

Executive Committee.

LLOYD'S NEW AMALGAMATOR

Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $10 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 6 0 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 15¾ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold	$73 33
Silver	42
To the Ton	$73 75

The assay being made by Messrs. Molitor & Co.

From 2½ pounds of the same ore, worked for the same party, was obtained:

Gold	$63 30
Silver	04
To the Ton	$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 54.2 per ton; and over the works at the mill, $62 54.2 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $ .19, Silver, $1.52, amounting to $2.71-100—equal to $136.33-100 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $ 54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.

Result of 68 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 6.8-10ct. Assay made by Messrs. Molitor & Co. 1-0 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58-100—equal to $111.60 to the ton. Difference in favor of Lloyd being $104.58-00 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustell Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Notice to James M Ross, or his Heirs:—You are requested to call at this Office, where information of importance awaits you. Said Ross left San Francisco, in June last, for Noyo Mills.

From Folsom street Wharf, at nine o'clock A. M., punctually,

FOR PANAMA.

Passengers will be conveyed from Panama to Asphnwall by the Panama Railroad Company, and from Asphnwall to New York by the Atlantic and Pacific Steamship Company.

A. B. FORBES, Agent P. M. S. Co.,

Mr. Jarvis Jewett is our duly authorized advertizing agent and collector in this city.

To Druggists and all Prescribing for Neuralgic and Nervous cases.—Your attention is called particularly to the efficacy of WATTS' NERVOUS ANTIDOTE for the above. Feelings of humanity, independent of pecuniary considerations would prompt you to recommend it to all cases of Neuralgic Pains, Face Ache, from defective teeth, and the General Wasting Away and Debility of the Nervous System, if you could have the assurance that this was what it is purported to be—THE GREAT RELIABLE TRANQUILIZER AND RESTORER OF THE SYSTEM. It has been repeatedly prescribed in cases of excessive drinking, on the verge of Delirium Tremens, and even while laboring under its disturbing influence, with astonishing results. It contains no preparation of Opium or Valerian, and is never accompanied with the unpleasant sensation always experienced after taking excessive doses of them. It is also the best Soothing Syrup in use. Patients have taken Watts' Nervous Antidote many months in succession, and experienced no unpleasant effect whatever—while the same continued use of many other popular remedies has completely shattered the system.

For sale, Wholesale and Retail, by SAMUEL ADAMS, U. S. Drug Store, corner of Pine and Kearny Streets, San Francisco. 6-3-3m

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Iron Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

PACIFIC IRON WORKS,

First street, between Mission and Howard streets,

SAN FRANCISCO.

GODDARD & COMPANY,

—MANUFACTURERS OF—

STEAM ENGINES & BOILERS,

QUARTZ, FLOUR, SAW AND SUGAR MILLS,

AMALGAMATING PANS AND BARRELS, MINING PUMPS AND HOISTING GEAR, WATER WHEELS,

And Machinery of Every Description.

Also furnish all kinds of Iron and Brass Casting. Only Manufacturers of the celebrated Bryan Battery. 1-tf

—MANUFACTURE—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangements will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 127 and 129 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

PEOPLE'S NOMINATIONS.

To the Voters of the City and County of San Francisco:

Your Committee, appointed to make municipal nominations for the coming election to be holden on the 17th inst., have, after mature deliberation, nominated a ticket which they are fully satisfied will meet your approbation, and will receive your cordial and undivided support.

As loyalty to the Federal Government is, in our opinion, the first test of a candidate's qualification for office, we have exacted a pledge of the same for every one of the nominees, and fully believe in presenting the following ticket, that there is not the name of a single individual upon it who will not bear the strictest scrutiny in this respect.

We would earnestly recommend the closing of all places of business on election day.

Rubicon Gold & Silver Mining Company No. 1. Rubicon Gold & Silver Mining Company No. 2. Rubicon Gold & Silver Mining Company No. 3. Rubicon Gold & Silver Mining Company No. 4.—Keys District, Mono county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Companies, held on the 18th day of April, 1864, an Assessment of ten cents per share was levied upon the capital stock of said Companies, payable immediately, in U. S. gold coin, to the Secretary, at the office of the Companies, No. 302 Montgomery street, San Francisco. Any stock upon which said Assessment shall remain unpaid on Saturday, the 21st day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on FRIDAY, the 10th day of June, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees,

J. P. VAN HAGAN, Secretary.

Office, Rooms 7 and 8, third floor, No. 302 Montgomery street, San Francisco. 17-4t

Queen of Antilles Consolidated Gold and Silver Mining and Tunnel Company, Lander county N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of March, 1864, an Assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable on the 9th day of April, 1864, in United States gold coin, to the Secretary at his office 523 Clay street, San Francisco, or to the Superintendent, H. Henderson, Austin, N. T. By order of the Board of Trustees.

G. B. LARRABEE, Secretary.

Office, 523 Clay street, San Francisco. 17-4t

Pearson Gold and Silver Mining Company, Lander County, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of March, 1864, an Assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable on the 9th of April, 1864, in United States gold coin to the Secretary at his office, 523 Clay street, San Francisco, or to the Superintendent, G. W. Leet, at Austin, Lander county, N. T. By order of the Board of Trustees.

G. B. LARRABEE, Secretary.

Office, 523 Clay street, San Francisco. 17-4t

Silver Star Gold and Silver Mining Company.—Office No. 706 Montgomery street, San Francisco.

Notice is hereby given, that, in accordance with the laws of the State of California, and an order duly made by the Board of Trustees of the Silver Star Gold and Silver Mining Company, there will be sold, at Public Auction, at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on WEDNESDAY, May 25th, 1864, at 11 o'clock A. M. of that day, to the highest bidder, for cash, in U. S. gold coin, so many shares of the capital stock of said Company, standing in the names of the following shareholders, as will be necessary to pay the Assessments duly levied thereon, and now being due and unpaid, together with the expenses of advertising and sale—to wit:

Names.	No. of Certifs.	No. of Shares.	No. of Assts.	Amt.
Henry Gerke	—118 to 124, 126 to 135, 137 to 145, 245	610	3 & 4	$549 00

We have received the first number of the eighth volume of this interesting paper. It is now under the control of friend Dewey, and has been enlarged to sixteen pages. We commend it to miners, stock dealers, and others taking an interest in the development of the mineral lands of this State. It can be had for $5 a year, and if preserved will make two volumes of interesting matter, containing 416 pages each.—*Red Bluff Independent*

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment levied on the 15th day of January, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
W. S. Pearson	75, 76, 77, 78, 79, 80, 81, 82	100	$10 00
G. P. Swift	11, 61, 62, 64, 89	208	20 80
E. Swift (4th & 5th asst)		221	44 20
H. A. Thomas (4th and 5th asst)	55	8	1 60
H. T. Grnves (4th and 5th asst)	9	10	2 00

And in accordance with law, and an order of the Board of Trustees, made on the 14th day of April, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the salesroom of Jerome Rice & Co., on the 16th day of May, 1864, at the hour of 11 o'clock A. M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

A. B. CRAVES, Secretary.
17-4t Office, 412 Clay street, San Francisco, Cal.

Whitton Gold and Silver Mining Company, Silver Mountain, Alpine county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of April, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable immediately to the Secretary, J. Warren Clark, 430 Montgomery street, San Francisco, (Room No. 5, 3d floor) or to S. A. Bartlett, Treasurer, Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on the 21st day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of June, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
Office, 430 Montgomery street, San Francisco. 17

By order of the Board of Trustees.
A. B. WINEGAR, Secretary.
17-4t No. 322 Front street, San Francisco.

Balazette Gold and Silver Mining Company, Lander County, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of March, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on the 9th day of April, 1864, in United States gold coin, to the Secretary at his office, 528 Clay street, San Francisco, or to the Superintendent, C. W. Leet, at Austin, Lander county, N. T. By order of the Board of Trustees.
C. B. LARRABEE, Secretary.
Office, 528 Clay street San Francisco. 17-4t

The Mining and Scientific Press comes to us enlarged to double its old dimensions, and otherwise improved. The Press is the only journal on this coast devoted exclusively to mining and scientific matters, and should be read by miners everywhere. It is published weekly, at $5 per year.—*Oroville Union.*

Billett Gold and Silver Mining Company—Office, 509 Clay street, San Francisco, California, April 16th, 1864.—Whereas the Board of Trustees of the Billett Gold and Silver Mining Company, at a meeting duly called and held on the 5th day of March, A. D. 1864, directed, by vote, that an assessment of twelve and one-half (12½) cents per share be, and the same was thereby levied and assessed, on each and every share of the capital stock of the said Billett Gold and Silver Mining Company, payable immediately, in gold and silver coin of the United States, and that the Secretary of the said Billett Gold and Silver Mining Company sell the delinquent stock, first advertising the same for thirty (30) days, according to law, after causing notice of said assessment to be published according to law and the by-laws of the said Company; and whereas notice of said assessment has been published according to law and the order aforesaid, and the following named shareholders have made default in the payment of said assessment in the number of shares held by them, and set against their names respectively, as follows—to wit:

	Shares.	Amount.
A. Bryant	149	$18 63
Levi Lee	30	3 75
James Lefferts	5	62
M R Miller	20	2 50
A T Nesbitt	10	1 25
James Billett	217	27 13

James Hamilton	82	10 25
John H Fowler	12	1 50
Whitehead Fowler	10	1 25
B F Nickerson	188	23 50

Now therefore, under and in pursuance of law and the order aforesaid, notice is hereby given, that so many of the shares standing in the names of the persons above mentioned respectively, as will be necessary for the payment of the assessment aforesaid, together with the expenses of advertising and other expenses of the sale, will be sold, according to law and the by-laws of the said Billet Cold and Silver Mining Company, at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, in the city and county of San Francisco, California, on WEDNESDAY, the 25th day of May, A. D. 1864, at 11 o'clock A. M. of that day, unless said assessments, with accruing charges, are previously paid. By order of the Board of Trustees. (16-4t) D. B. FRANCIS, Secretary.

Saxon Copper Mining Company, Calaveras Co., Cal.—Notice is hereby given that in accordance with the laws of the State of California and an order duly made by the Board of Trustees of this Company, there will be sold at Public Auction at the office of the Company, at Copperopolis, on the 10th day of May, A. D. 1864, at three o'clock, p. m. of that day, to the highest bidder, for cash, in United States gold coin, so many shares of the capital stock of said Company standing in the names of the following shareholders as will be necessary for the payment of the assessments duly levied thereon by the Board of Trustees, together with the expense of advertisement and sale, unless said assessment and charges are paid before said sale.

A. S. HALLIDIE & CO.,

WIRE ROPE MANUFACTURERS.

Established 1857.

Office, No. 412 Clay street—Works, North Beach,
SAN FRANCISCO.

After seven years' use throughout the State of California and the Pacific Coast generally, we can confidently recommend Wire Rope for

HOISTING FROM DEEP MINES,
GUY ROPES FOR DERRICKS, &c.,
STANDING RIGGING FOR SHIPS,
FERRY ROPES FOR FERRIES,
SASH CORD FOR WINDOW SASHES,
ETC., ETC., ETC., ETC., ETC., ETC.

It being Cheaper, Stronger, Lighter and More Durable than any other kind of Rope, and not stretching or shrinking by atmospheric changes.

MINING COMPANIES, by using it for Hoisting Purposes, save 66 per cent. on their outlay for other ropes.

Wire Fencing Strand,

For fencing large parcels of land—permanently, economically and expeditiously. Manufactured in any length desired.

Pamphlets containing weight, strength and price, forwarded free on application to the Manufacturers.

WIRE SUSPENSION BRIDGES AND AQUEDUCTS

We are prepared to erect, of any span and capacity, and take pleasure in referring those interested to the many structures of this kind built by us in California, Oregon and British Columbia, of span from 200 to 400 feet. 3-3m

MINERS' FOUNDRY
—AND—
MACHINE WORKS,

First street, between Howard and Folsom streets,
SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, of the **Best** and **Most Economical**, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

tf. HOWLAND, ANGEL & KING.

Vulcan Iron Works Company.

P. Torquet.....Manager.
Steam Engine Builders and Boiler Makers, Iron Founders and General Engineers,

PUMPING, HOISTING, MINING AND QUARTZ-CRUSHING Machinery. Shoes and Dies of the hardest iron. Russia Iron Punched Screens, Steamboat Machinery, Saw, Flour and Sugar Mills. High and Low Pressure Boilers of all styles. Jonval and other Turbine Water Wheels with latest improvements.

tf No. 137 & 139 First Street San Francisco.

IMPROVED WATER-WHEEL,
— PATENTED BY —
John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUM COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15v3-3m Golden State Iron Works, San Francisco.

WHEELER'S
Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

*** These Pans may be seen in daily operation at the Miners, Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surfaces to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

Farrand's New
AMALGAMATOR & SEPARATOR!
THIS UNRIVALLED MACHINE IS NOW IN OPERATION AT THE
Eureka Metallurgical Works,
Commercial Street, between Front and Davis,
WHERE ALL KINDS OF ORES ARE REDUCED AND SAMPLED.
Particular attention given to Sampling Copper Ores.
This Amalgamator is capable of doing double the amount of work of the ordinary pans, at a saving of one half of the power, and at a much less cost in the original purchase.
Another very important advantage connected with this machine is the fact that it may be cleaned in fifteen minutes, without removing the plates or any other portion of the machine.
Manufactured at the Miners' Foundry, San Francisco. All communications should be addressed to R. L. OGDEN, Agent.
Cor. Montgomery and California streets, San Francisco.

Advantages of Farrand's Amalgamator.
In offering this Amalgamator to the public, the inventor does not claim any new or scientific method of extracting the precious metals from the ores; he merely claims a new and simple combination of mechanical principles, whereby a great saving of power (full one-half in amount) is affected. The capacity of the machine varies with its size, the smallest, or prospecting size, will reduce 300lbs. in three hours, and can be easily worked by the power of one man. The largest size will work 1,500lbs. every three hours, or six tons in 24 hours, with an application of a trifle more than one-horse power. This saving of power, as all mill-men are aware, is a very important consideration, particularly in localities where fuel is scarce. The power so saved in running the Amalgamators may be advantageously employed to an increase of stamps, and thus proportionally increasing the work of the mill. This machine consists of a semi-cylindrical, trough-shaped vessel, the interior of which is furnished with moveable concave dies, to be replaced when worn out, as in ordinary pans. The mullers are convex, and attached to a substantial rock shaft, by which they are moved back and forward by crank or eccentric motion. The mullers are held to their places by springs of moderate strength, the pressure of which may be easily regulated. The oscillating motion of the mullers serves to keep the pulp in a constant state of agitation, thoroughly mixing it and passing it under the mullers without resort to any of the various expedients employed in Pans where a circular motion is maintained. In working this Amalgamator no quicksilver is placed in the pulp until the trituration is completed. That done, the mullers are raised, so as to completely break contact with the dies, the quicksilver sprinkled into the mass and the machine set in motion again, the mullers simply acting as stirrers, which they do most effectual. The peculiar construction of this machine admits of its being worked with a much smaller charge of quicksilver, to any given amount of pulp than Pans. The spiral springs greatly assist in the work of reduction, by allowing the free admission of the pulp between the mullers and dies, so that the pulp is made to actually work upon itself—as the dust of the diamond is made to reduce the gem itself. The advantage derived of thus avoiding all trituration in the presence of quicksilver, must be apparent to every one at all acquainted with gold or silver amalgamating. Trials made with this machine in the presence of experts, during the last four months, have been pronounced highly satisfactory. It is peculiarly well adapted to employment by small mining operators in distant localities, as it can readily be taken to pieces and packed upon mules. It is intended to construct a large size machine, without dies or mullers, but simply with arms, to act as stirrers; said machine to be used in connection with several of the Amalgamators as a "Separator," as it is found that the peculiar motion given to these arms, in connection with the concave shape of the body of the machine, renders it most effectual for such a purpose. WM. D. FARRAND.
17-1m San Francisco, March 28th, 1861.

MINING NOTICES—MAY 14th.

Rubicon Gold and Silver Mining Company, No. 3. Location of mine, Keys District, Owens' River, Mono county, California.

Notice is hereby given, that in accordance with the laws of California, and an order duly made by the Board of Trustees of the Rubicon Gold and Silver Mining Company, No. 3, there will be sold, at public auction, to the highest bidder, for cash, in United States gold coin, on the 14th day of June, 1864, at 11 o' clock A. M., of that day, at the office of the Company, No. 7 & 8 third floor, No. 302 Montgomery street, San Francisco, so many shares of the Capital Stock of the Company, standing in the names of the following persons, or shareholders, as will be necessary for the payment of assessment No. 4, of ten (10) cents per share, duly levied thereon February 27th, 1864, by the Board of Trustees, together with the expenses of advertisement and sale, unless said assessment and accruing charges are previously paid.

Palmyra Consolidated, Palmyra.....Sale June 13th

Mount Vernon, Smoky Valley, 50 cents..Adv. June 11—Sale June 25th

Ophir of the Colorado No. 1 Gold and Silver Mining Company.—Office No. 620 Washington street, San Francisco.

NOTICE.—There is delinquent upon the following described stock, on account of assessments levied on the 20th day of August, 1863, of thirty (30) cents per share, on each and every share of the capital stock of said Company, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certs.	No. Shares.	Amt.
Charles Hamilton	54	200	$60 00
Charles Hamilton	55	50	15 00
Charles Hamilton	56	20	6 00
Charles Hamilton	57	20	6 00
Charles Hamilton	59	20	6 00
Charles Hamilton	60	20	6 00
Charles Hamilton	61	10	3 00
Charles Hamilton	62	10	3 00
Charles Hamilton	63	10	3 00
Charles Hamilton	64	10	3 00
Charles Hamilton	65	10	3 00
		380	$114 00

And in accordance with law, and an order of the Board of Trustees, made on the 7th inst., so many shares of said stock as may be necessary, will be sold, at Public Auction, at the office of the Company, June 11th, A. D. 1864, at the hour of 12 o'clock M., to pay said delinquent assessments thereon, together with cost of advertising and expenses of sale, unless sooner paid. Location of claim, Colorado District, El Dorado Canon, Territory of Arizona.

RODNEY CLARK, Secretary.

San Francisco, May 7th, 1864. 20-4t

Mining and Scientific Press.

A Mining Journal--Devoted to News, Art, Science and Progress.

VOLUME VIII. SAN FRANCISCO, SATURDAY, MAY 21, 1864. NUMBER 21.

Contents:

No. 21—May 21.—Twenty Pages.—Desulphurizing Coals The Formation of Metallic Veins—No. IV.; The Red Copper Bend with Borax; Letter from Silver Mountain; Reese River Correspondence; Reese River—Amador District; State Geological Rooms; MINING STOCKHOLDERS' DIRECTORY—Contains List of all San Francisco Mining Notices; Prices Bid and Asked at the Stock and Exchange Board, and Total Sales of the Week by all the San Francisco Boards; Mechanical—Home Industry—Pacific Foundry; Mineral Claims for School Purposes; California Barrel Manufactory; Patents and Inventions—Patent Extension Schemes; O. H. Taylor's Amalgamator, A New Magnetic Engine, Hay-loading Machine; Mining Gossip; Original Items; Summary of Mining News—Californita, Washoe and Humboldt, Etc., Etc.—Owensville and Its Mines.—Monitor District, Alpine County.—Washoe Items.

Desulphurizing Coal.—Mr. J. J. Keating, of Stockton, is experimenting in that city with some apparatus for desulphurizing coal. The proecss has heen patented. If it should prove successful, says the Stockton *Independent*, the process will he of much value, as all the coal used for mechanical purposes in forging iron is now imported at a cost of from thirty to forty dollars per ton, whereas the product of our own coal mines, if this desulphurizing process succeeds, can he supplied for less than half the cost. The process of extracting the sulphur is hy a general chemical application, and, of necessity, the ingredients used must be volatile in their character. Blacksmiths will soon have an opportunity of testing the coal after it has gone through the process, and their report will be looked for with interest.

We may observe, in reference to the above, that the value of the result aimed at has long since ceased to he in douht; hut our Stockton contemporary does not give us a clue to either the new method or its progress. Of past workers in this direction, Mr. Calvert, an English chemist, long since patented the use of salt based on these reactions. "Bi-sulphuret of iron is decomposed hy heat, and in contact with salt forms, among other products, chlorids of iron, and this, in the presence of water, at a high temperature, is resolved into oxide of iron and hydrochloric acid." A late writer of authority, in reviewing the results of experiments with salted coke, as published hy the inventor, says that they are not conclusive as to the effect on the coke. It is obvious that any improvement obtained in the result from the smelting furnace, may have heen produced there, without any previous alteration in the coking oven. Some advantage does, however, seem to have been obtained, whether the one invented and patented is another matter. A correspondent (also a chemist) writes us that he was present in the laboratory of Dr. D. Parmelee, in New York, last year, and saw a coke submitted to analysis which had been prepared by a secret process that was much vaunted for this especial purpose; but it contained too much sulphur to be recommended for the object required—melting iron direct from the ore.

"The American Mining Gazette and Geological Magazine" is the title of a new magazine which has made its appearance in New York, the first number of which is before us, and contains eighty-four pages of valuable reading matter, all of which is appropriate to a publication hearing the above title. The opening number of this magazine augurs well for its success—at least if success is in any way founded upon merit. It will always he a welcome visitor to our table. It is published at 79 Pine street, New York, by Gilbert E. Currie, at $5 per annum, in advance.

[Written for the Mining and Scientific Press.]

Owensville and Its Mines.

Messrs Editors:—Since my last communication, I have been camped in the vicinity of this place and have carefully noted its progress, also the development of its neighboring mines. Our miners are deserving of much praise for what they have done towards the development and improvement of so rich a mining and agricultural district as this now seems to be.

The several mining companies in this district are busy opening and prospecting their claims. They all have a large amount of work before them, and up to the present time have been successful in getting good rock from their ledges. Among these companies now organized and at work are the Rubicon, San Francisco, Marathon, Great Western, Golden Wedge and Silver Creek Companies. But little attention is now paid to mines except those of quartz. A few are still prospecting for placer diggings in the foot-hills of the Sierra Nevadas hut with little prospect of success. So far as I have examined the ledges in this district, I have met with none which were not well defined and apparently permanent. Assays of two and three thousand dollars per ton are quite common; one made from the Marathon went over $3000. Carbonate of silver, a rich and rare mineral, is said to he found in some parts of this ledge.

With regard to the progress of the Valley it is seldom we meet with as much improvement made in so short a time. Six months ago it was considered unsafe to travel in this portion of the valley, except in parties of ten or more. Not a habitation of any kind was then to be seen; but as soon as the wealth of the mines became known, the aspect of the whole country changed, and instead of travelers and prospectors rushing past dangers, and leaving behind them the hidden wealth of the valley, they concluded to stop and try what virtue there was to he found in a possessory title. People settled so rapidly in the valley and mines, that the Indians thought it prudent to keep quiet, and have made a most favorable treaty of peace and friendship. Joaquia Jim, is allowed to go and come when and where he pleases, although much to the chagrin of many old prospectors.

Owensville is the center of a large agricultural and mining country, and is growing rapidly. Several fine stone buildings have been built, three of which are used for groceries and dry goods stores; others for store-houses for the different mining companies, and others still for dwelling and boarding houses. Several wooden houses are going up and some are already completed. The Saw Mill, on Big Pine Creek furnishes the best class of pine lumber at $75 per thousand; another mill will soon he built on Bishop's Creek, at a point some ten miles west of this place. The farming community is constantly increasing, and many fields of barley and other grains are looking well. The principal crops this year, will be barley and vegetables.

A division of the Sons of Temperance has been organized and meets at Owensville; we are also favored with divine service occasionally. The climate here is delightful, no place where I have been can compete with it for healthfulness. There is an abundance of grass throughout the valley and river bottoms.

A Prospector.

Preparations for the Mechanics' Fair are going on actively.

Mining and Assay Class.—Professor Price will commence his third mining and assay class about the first of June next, at his Laboratory, No. 5, First street, in this city. We are pleased to state that the efforts of the Professor to establish a permanent mining and assay school in San Francisco, are meeting with the most abundant success. His present class, now drawing to a close, numbers over twenty members, all of whom unite in according to him the highest meed of praise for his untiring and most successful efforts in imparting instruction in this difficult yet important branch of education. The laboratory is now well fitted up for work, and pupils enjoy every desirable opportunity for an agreeable and successful prosecution of their studies, both in the theory and practice of assaying. All persons engaged in the active operations of mining or prospecting, who have not already availed themselves of similar opportunities, should embrace the facilities now afforded them to prepare themselves for manipulating and examining the various ores met with in the mines in a scientific and practical manner. We understand that the Professor will soon commence a class in analytical chemistry, at the same place as above, but on other evenings, where all who wish to become acquainted with that useful and interesting branch of science, will have an opportunity to do so under facilities rarely offered outside the walls of our leading collegiate institutions.

Virginia and Gold Hill Directory.—We have received the prospectus of the above named Directory, which will he issued and ready for delivery about the first of July, by Mr. Charles Collins, who is now in this city superintending its publication. In addition to the usual features of a business directory, it will also contain a full and carefully prepared mining directory, giving the names of the different companies, their Secretaries and places of business. It has been the aim of the publisher to secure accuracy, rather than extent in the information given. The work will contain upwards of 300 pages, and will form a valuable handbook of statistical facts and useful information to every person interested in matters pertaining to Virginia City and Gold Hill. J. M. Wolf, the enterprising agent of the Mining and Scientific Press, has collated the mining directory.

The New York Rioters.—No official account has ever been published of the loss of life in the New York anti-draft riots, of July last. The Syracuse *Journal*, however, in a late issue, states on what it considers very reliable information, that the number who paid the forfeit of their lives for the outrages committed during those four terrible days of anarchy cannot fall short of 1,150, while some set it as high as 1,500. The larger portion died from the effects of blows from policemen's clubs. Very few, comparatively, died upon the ground, or in the heat of the excitement. A large number of the rioters will carry the marks of their punishment to their graves. The lesson has been a fearful one to the lawless and disorderly masses of that great city.

THE FORMATION OF METALLIC VEINS.

NUMBER IV.

BY EDWARD A. MILES.

In the geological systems of veins, extensive surfaces undergoing decomposition must produce a large amount of electricity; a multiplication of surfaces, instead of adding to the quantity, gives, according to electrical laws, intensity or force to the original current in direct ratio with the increase. The electricity moving from the most to the least decomposable surface finds its poorest conductor in the quartz or spar of a vein wherein the quality of intensity is exerted for its passage. And in this most durable rock of the galvanic series of plates the higher metallic forms become fixed beyond eventual removal by the same working power. Near all true fissure veins there are found two or more kinds of bed rock, each decomposable in different degrees, while many segregated veins are connected with but one general mineralogical formation. In direct keeping with voltaic analogies, the most favorable metallic veins exist at or near the divisional line of two different mineralogical strata, and local variations of the magnetic needle are often noticed by surveyors to be very great near such lines, particularly where no veins exist. In most rich mining sections a still further compound character is given to the system of the true vein by the presence of other veins, generally poor, but assisting in the enriching operation. The number and position of these, when acting as branches, spurs or cross veins, as intercceptors of the currents flowing along the planes of those strata not within the immediate influence of the main vein, have a decided bearing on the metallic wealth, the junctional points of all such connections being usually the richer portions of a vein.

According to their particular dispositions to be deposited or removed from solution by the opposite poles of a galvanic battery, the simple elements have been relatively divided into electro-negative and electro-positive bodies, and in proportion to their greater separation in the scale, so increase their natural affinities for each other. Gold and silver are intermediate between silicon, on the one hand, and calcium and magnesium on the other. Thus, in referring back to the explanation of the chemical process by which veinstone is deposited, if gold existed with magnesia in extremely microscopic proportion, it would have had a different affinitive choice when the latter united with the carbonate of lime, and consequently sought an alliance with the quartz, with an aggregating tendency to unite with the already deposited atoms of its own kind.

As in nature no two scenes can be discovered exactly alike, so in the essential features of geology, mineralogy, topography and operating causes, no two mining districts can be said to totally correspond. For this reason, there must ever be a difference in their electrical influences and creations.—The respective ores of the Mexican, Californian, Virginia City, Silver Mountain, Esmeralda, Reese River and Humboldt mines are easily distinguishable from any others; and so also are the specimens from numerous ledges of a district recognizable by name under the inspection of an experienced quartz miner. With veins formed by infiltration from the surface, or by igneous eruption, there should only be found the general deviation of structure seen in sedimentary beds and igneous dykes.

There is a form peculiar to each distinct combination of metals, and a clear connection with the quartzose and sparry crystallization. Gold and tin have veinstones approximating to their own closeness of texture in deposit, while the matrix of silver takes the more crystalline character assimilating to that of its ores. *Points* best give discharge and reception to electricity; with two parallel plates of quartz, the points of whose crystals are in opposite juxtaposition, there may be supposed a concentration and a rapid interchange of electricities through the fluid flowing between, whereby the metallic elements are deposited from solution on one or both plates, bands of sulphurets being formed in narrow spaces, and nodules in geode-like cavities. After the crystals have aggregated metals, so as to be unable to operate with sufficient electro-chemical power, in consequence of greater dispersion, the silica, by reason of its disposition to cover rough surfaces, forms thereon other bases of crystallization. The delicate lines or rays of crystals often penetrate a mass of ore, but never free from a connection with the main body of quartz.

From numerous specimens in the writer's possession, showing the progressive developments of veins, he will select two pieces of argentiferous quartz from Washoe. One of them on both sides shows portions of its former porphyry attachment to the walls of a fissure; at one end, in the middle, the interlocking of the crystals of two plates is quite evident, while lower down they are joined together in one homogenous mass. Midway between the side and center on either plate, are two wavy bands of sulphurets, whose parallel lines of contour are in direct proportion to each other, although divided by a slight partition of quartz. It is evident, from the peculiar radiation of the quartz, that the sulphurets have at two intervals of time filled the crystalline faces of the plates, and then suffered entombment while acting as the bases of the internal crystallization. The other piece has its face of small crystals thickly spattered with thin blotches of antimonial silver, and in a few cavities crystals of the same. The surface has a general dusky appearance, and on examination with a magnifying glass shows fine black lines of metal webbing the angular spaces between the crystals. The latter piece also holds a portion of the slate wall rock in a forward state of dissection and decomposition, being minutely divided by small veins of quartz containing metal. In Butte county, in this State, there is a ledge, or rather series of quartz and slate bands, of considerable width altogether, wherein the dissimilar forms of shot, flake, fine and wire gold occupy respective places or bands, distinguished by separate peculiarities of structure. In Europe are large veins, and in this country smaller ones compounded of distinct vertical bands or plates of quartz, and the various spars, each possessing different metallic contents. These distinctions of structure and impregnation indicate various modifications, seats and eras of electrical action.

In certain highly siliceous geological formations it is apparent that the electro chemical power may be greatly exerted in enlarging quartz veins with but little, if any, acquisition of metals. After costly experience with a large ledge, well defined even at a depth of five hundred feet, and according to the theory of igneous origin well bestowed with neighboring erupted dykes, though altogether siliceous in nature, this fact became forcibly impressed upon the writer's mind, and induced him to turn his attention to the mineralogical associations of veins.

In the art of electro metallurgy, the character of the metallic deposit which an operator desires to secure in a mould or on a cast, is regulated by the intensity and quantity of the electricity, as compared with the strength of the solution, or, in other words, as the combative force and quantity of the acting current in contrast with those intrenched in the solved elements. Without entering into an explanation of the particular relations required, it is only needful to state that thereby the metals are differently deposited, as particles too fine to reflect a ray of light, and consequently black as sand, in a spongy and a grainy form, as separate crystals, and, when the currents are nearly equal, in a reguline or compact deposit. These results show the variations that can be and are produced in veins by electricity.

Besides the original operations of the electro-chemical power in veins, there seems to have been, in some instances, secondary action, owing to local or other influences, bringing about decomposition and removal of the base and concentration of the valuable metals. The more stable metals under this condition have thrown off their common alliance with sulphur and other elements, being either reduced to a pure form, or modified into chlorides, sulphides, bromides, etc. In some veins of this class the writer has observed on the sides of the natural seams in the quartz, numerous images composed of metallic oxides, and resembling the brush discharge of machine electricity. Similar images of pure silver are common in some Mexican mines, and may result from the discharge of thunder clouds.

To the voltaic mode of accretion can be assigned those metallic formations possessing no distinct vein stone, such as contact deposits existing between two dissimilar geological and mineralogical strata, and disseminated deposits, such as platina in trap rock. The successful copper mines of California assimilate to the former character. The absence of veinstone in contact deposits, may result from the confinement of the electro-chemical agency to the more solvent metals which distinguish them. From what the writer knows of the surroundings of copper veins, he should say that they are created by a subdued working power. The masses of copper sulphurets in the mines of our State are attended by flanking walls of talc, which perhaps possess the same essential characteristics for the electrical action as veinstones mingled with other ores.

The presence of a common attendant of volcanic eruptions, sulphur, in combination with metals, has, perhaps, as much as anything else, induced a belief in the igneous construction of veins. Yet sulphur is as universally dispersed throughout the earth as iron, and is no more a companion of volcanic heat than it is of water and inert earth.

Much stress is also given to the occurence of slaty strips, termed selvage bands, along the sides of veins and visible striations, seemingly from mechanical friction, between the walls and veinstone, in the line of their dips, as a strong proof of the igneous creation of veins. The former appear to be intermediate in character between the veinstone and walls, and are no more remarkable than similar bands occasionally seen in masses of quartz; their metamorphism, through the impregnation of iron or silica, indicates water rather than fire as the agents. The striations often mark the direction of rich pockets or chambers, usually leading from one to another at different angles with the dip of the veins.. They are, undoubtedly, the crystalline paths of strong electrical working.—Similar looking striations exteriorly mark the direction of the chief axis of the crystals of tourmaline and other minerals. In the Reese River mines, where they are frequently seen scoring the smooth walls of veins in the granite formation, the writer had all doubts of their origin removed from his mind on examination of the rotten metamorphosed granite, at water level, in one of the shafts. The moist rock for some distance from any quartz, peels down in broad flakes a few inches thick, showing the exterior smoothness and grooving noticed in the hard upper walls of the veins. The lines of lamination curve more or less in various directions, with, however, one general tendency toward the nearest veins.

[To be Continued.]

[Written for the Mining and Scientific Press.]

The Red Copper Bead With Borax.

Mr. Editor:—On page 249 of this volume of your paper, you inserted a short notice from me of some laboratory observations with the blow-pipe. I then stated that the result with protoxide of iron was "nearly as sensitive a reduction *of* the copper" as with the tin. This phenomenon of the red coloration of the bead with copper has since received additional interest from a fact communicated to the *Chemical News*, of London, England, by a Mr. Garland, and the result is one of much practical importance. It has been determined by that gentleman that this color is not produced in the deoxidizing portion of a *gas blow-pipe jet* as it is with the mouth blow-pipe; but also that this color is produced on re-heating the colorless bead first obtained with borax on the platina wire when copper is present. His whole communication is well worthy of attention, as he founds on the new re-action, a process of blow-pipe analysis for copper, in presence of other metals.

This matter also affords a very instructive illustration of the importance to be attached by all blow-pipe experimenters to the objections raised by Berzelius to any alteration of the usual methods of applying a jet from the month. It should ever be borne in mind that it was with such a jet that he obtained the re-actions he published. We depend in great part on producing them, as he did, for the interpretation of the same appearances as indications of the same minerals. He ascribes to the mouth blow-pipe jet a definite temperature—the air supplied from a reservoir producing the same temperature will obviously have a different composition. He will be a bold experimenter who will venture to assume the identity of results, obtained with different agents applied to unknown materials, and the absence of experiments cannot be compensated by any supposed convenience. Where a definite operation, such as expellation, is to be performed, a mechanical substitute for the mouth may of course be permitted, as it will involve no such source of error.

J. H. Churchill.

San Francisco, May 14, 1864.

Another Foundry in Washoe.—Messrs. McCurdy, Brothers & Co., are erecting a new foundry and machine shop, to be called the Gold Hill Foundry. The site selected is the space between the Nevada Hotel and the Imperial Mill. It will be in operation in about four weeks.

[Written for the Mining and Scientific Press.]

Letter from Silver Mountain.

Messrs. Editors:—The Silver Mountain mining region has been generally known abroad as comprising all the mineral section between the summit of the Sierra Nevada mountains and the eastern boundary of the State of California, now included in the new county of Alpine. Though this designation was doubtless applicable immediately after the discovery of silver bearing rock in the numerous ledges which traverse the country, more distinct specifications are now required to determine the numerous locations and interests. The country has therefore been divided into different mining districts, among which we find Silver Mountain, Alpine, Mokelumne, Mogul, Monitor, Raymond, Silver King, Highland and Genesee, all within the new county of Alpine.

The town of Silver Mountain, in Silver Mountain district, is situated in a beautiful valley about six miles northeast of the summit of the Sierra Nevada mountains. Silver creek, which finds an eternal source in the mountain snows, flows through this valley with a sparkling purity which cannot be excelled. Lofty and rugged mountains of porphyry rise on all sides of this valley, except to the northeastward, where Silver creek finds an outlet through a steep cañon. About three miles below Silver Mountain, this creek forms a junction with the main Carson river.

The town of Silver Mountain is regularly and scientifically laid off into blocks and lots, all of which have long since had claimants. At the present writing it contains five stores which deal in general merchandise, one hardware store, two hotels, two blacksmith shops, one restaurant, one meat market, two sawmills, and several places where the "poison" is dealt which "maketh the brain mad." Many buildings are in course of erection, and so many different branches of business are in process of creation, that it is impossible to conjecture what may be the condition of business a month hence. It is probable, however, that each of the several business interests enumerated will be more than multiplied in a very few weeks, as the only impediment to the rapid erection of buildings is the want of lumber, which the two mills in operation cannot supply in quantities sufficient to meet the demand. Two additional sawmills are, however, in course of erection, and when put in operation the number of substantial and expensive buildings being erected will increase, and a town will at once arise, not like a "Phœnix from the ashes" of former greatness, but from the, ere while, silent wilderness.

I do not profess to be sufficient of a mineralogist to pronounce upon the future prospects of this new and extensive country from the "indications;" but it is certain that there can be no doubt about the absolute confidence of this people. They look forward to developments equal to anything yet discovered upon the continent, and believe that in a very short time Silver Mountain town will be a second and improved edition of Virginia City, in Nevada Territory. I cannot see any good reason why these great expectations should not be realized. If they have but the mineral they have every facility a kind and provident Nature has afforded to any portion of the Pacific slope. Healthy climate, abundance of the purest waters, and a plentiful supply of timber. Of the ledges they seem to have no doubt. The only question is as to the means and appliances for extracting the mineral.

Among the lodes which have attained notoriety in Silver Mountain district, are the I.X.L., Big Mountain, Lady Franklin, Forest Queen, Gould & Curry, Buckeye No. 1, Buckeye No. 2, Twin, Noble, Murphy, Mammoth, Geo. Washington, etc.

The Big Tree and Carson Valley Turnpike Company are busily engaged with a force of about one hundred and fifty men, completing the connexion with Silver Mountain. About two miles yet remains to construct, which, it is believed, will require three or four weeks, when there will be a direct and uninterrupted thoroughfare to Stockton, via Murphy's, in Calaveras county.

The energy and perseverance exhibited by these pioneers deserves a sure reward, while it adds additional weight to the evidence continually transpiring that this people will in time become the masters of every situation. Argent.

Silver Mountain, Alpine county, Cal.

Silver, it is said, has been discovered in the pineries in Burnett county, Wisconsin.

[Written for the Mining and Scientific Press.]

Reese River Correspondence.

NEW YORK CANON.

To reach this Cañon we have a rugged mountain to scramble over. This mountain was a year ago covered with pine wood and cedar, which is now stacked in piles ready for the mills and *habitans* of Austin. This hill is covered with slate, the genuine article, as it has scaled off and slid down. Quartz is also here in great abundance. Not long hence (mark the prediction!) great discoveries will be made here. The Whitener tunnel, in the New York Cañon, has been advanced to the distance of 150 feet through a bastard formation. There is an incline in the tunnel, from which it is said some fair looking quartz has been taken out. As the incline is now full of water, we were unable to see what sort of a ledge it was. This tunnel will have to be advanced about 200 feet further before they will strike the large ledge. The company undoubtedly possesses much nerve to have projected the tunnel thus far; but if they do not possess a plethoric purse we fear *they* will not reap the benefit of their labors. Lower down the Cañon we can see several holes, but have not the time to visit them. As we climb the ridge that divides New York Cañon from San Francisco Cañon, we pass the Montgomery Street ledge. This Company has an incline thirty feet down.

SAN FRANCISCO CANON.

Towering high in the air are the croppings of the Mountain King. This Company's tunnel has been advanced 150 feet into the mountain, and passes through two ledges, thirteen and four feet in width, but are running for the large ledge, fifteen feet in width. Immediately opposite the Mountain King, on the other side of the Cañon, are Forts Wagner and Sumter, beside the Highland Ranger. They are all large ledges. The incline on Fort Wagner is twenty-five feet in depth, and the ledge rock of good character. The Highland Ranger's incline is sixty feet in depth. Not far from the Mountain King's tunnel is the Mart Carroll and its extension. Not much labor has, as yet, been bestowed upon them. The cost of sinking an incline or tunneling in this Cañon must be double as great as it is on Lander or Oregon Hill. There are probably fifty other locations in this Cañon besides those I have named. Near the mouth of the Cañon is a pretty eight stamp steam quartz mill, erected late last Fall. It serves at present the purpose of prospecting the rock taken from the different ledges. But one divide or ridge separates us from the Amador district, but the day is far spent and we are weary, and will consequently wend our way toward Austin. The road we have taken the reader to-day is about fifteen miles, up and down, and on the sides of steep hills.

RESUME.

The Oregon, North Star and the Isabella, situated on Oregon Hill, and the Maggie, at Yankee Blade, are turning out steadily some of the richest argentiferous ore that ever gladdened the eye or weighed down the pocket of the master miner.

Apropos: The North Star G. & S. M. Co., incorporated in San Francisco, is not the Company whose ledge has produced so much of the silver ore; it is the first north extension of it, however, and when the work is done upon its ledge, may prove equally well. The Troy is widening, they say, and is very rich. Should it turn out much, siege will be laid to it for the "Helen" contained therein.

The weather is delightful; grass is springing up, and miners are setting out for the districts of Smoky, Santa Fe and Summit, which are considered the best, as they are contiguous. Amador sends in good reports. X.

[Written for the Mining and Scientific Press.]

Reese River—Amador District.

Messrs. Editors:—I have noticed, with pleasure, the numerous letters which you have published from various parts of the mines, and particularly from Reese River. Being well acquainted with that region, I can attest to the truthfulness of the statements therein given. Some of these mines, particularly those in Amador district, will warrant even more than has been said of them. The development of the Amador mine is well managed, but the manner in which its ores have been treated at the mills is anything but creditable; $417 per ton was taken, by assay, out of the tailings from a late crushing. There is much complaint made generally with regard to our mills, which is operating greatly to the disadvantage of our mines. There seems, also, to be an unmerited prejudice growing up on the part of our Washoe neighbors with regard to this region.

Among the prominent mines of this district, most of which have struck the water line, and all of which are developing fine mineral, I may mention the North Star, the Oregon Consolidated (very rich at a depth of 85 feet), the Roanoke, Western Oregon, Maggie, Oak Ranch, Tray, Isabella, Emma Funston, Vesta, Toronto, Stephen A. Douglas, Ontario, Plutarch, Gov. Seymour, Rubicon, Shenandoah Tunnel Co., etc. Each and all of these claims are well developed, with every indication of permanency. These facts I have obtained from personal observation.

The Amador district is fully equal, if not superior, in point of value, to the Reese River district. The Rough & Ready is one of the best defined ledges in the Territory. This claim, containing 1,800 feet, was located about eight months ago by some energetic miners from Rough & Ready, Nevada county. The surface rock from this claim has yielded, by mill process, $186 per ton, and that from its incline has gone as high as $847. They have now some seventy tons out, from which you can scarcely select a piece that does not show native silver. This company, since incorporation in March last, has levied no assessments, all expenses having been met from their crushing, and has now several thousands of dollars in their treasury. Numerous other mines in this district are considered equally good, though undeveloped to the same extent. I might mention the Old Hickory, Belmont, Sumter, Wagner, Standard, Legal Tender, etc. C.

The State Geological Rooms are now being fitted up with more than Oriental splendor, and are to be placed at a rent of something over $18,000 per annum. These preparations, however, have not been made to display to greater advantage that valuable collection of curiosities and remnants of former ages which should be the delight of every Californian, and which, could they be properly arranged, would form a profitable study for thousands who are eager to avail themselves of such an opportunity. These valuables are still packed and stuffed in dirty boxes, and pushed yet further away, to accommodate pleasure-seekers who have accidentally grown rich out of speculation in mining feet. The rich and glorious State of California is too poor to provide room for the precious treasures which have been gathered from her area with so much toil and care; but her citizens can pour out their thousands to support an establishment of at best but doubtful reality. For shame, gentlemen of the Legislature! for shame, citizens of San Francisco! to let the ball and cue out-bid and drive from your sight precious treasures which the learned and wealthy of Europe would gladly purchase at ten times their cost, and display with a care and pride totally regardless of expense!

The Present Irish Emigration to the United States, according to the Cork *Examiner*, is of a character superior to any which has preceded it. The great bulk is made up of stalwart young men, full of health and vigor, and fine looking young women, from the very best class of the Irish peasantry. Very few are seen poorly attired, and the general conduct of all is remarkable for propriety and soberness. The *Examiner* does not think there are many going with any view to enlistment, but that they are almost universally moved in this direction by the dazzling prospects held out by the lately improved labor market of the Northern States.

Bullion Railroad.—An iron railway track, has just been laid down in the office of Wells, Fargo & Co. at Virginia which, says the *Union* of that City, is a matter of wonder to many visitors until it is explained to them that it is for the purpose of carrying from behind the counter to the door the immense amount of bullion which is shipped to San Francisco daily by the Pioneer Stages. If it was stated in an eastern city, where greenbacks are almost the sole medium of exchange, that such a railroad had to be constructed here to convey the silver bars that are taken from our mines, the narrator would lay himself liable to the ridicule of his incredulous hearers.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corperation if it is not in San Francisco.

REVISED EVERY ISSUE.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

The First Bullion from Alpine.—The Markleeville *Chronicle* of May 13th says: Mr. Markleeville has shown us a ring, weighing one ounce, manufactured from silver taken from the ledge of the Galena Company. This is the first bullion from the Alpine District.

Vein Mining is a very complicated business; one in which it is easier to throw away money, perhaps, than in any other immense excavations in solid rock and heavy timbering, requiring judgment and skill—not always at command—expensive machinery to raise and crush or smelt the ore, pump out the water and raise and lower the men, and finally, thorough acquaintance with the science of chemistry and metallurgy in order to separate the gold from the ores, are requisite to success. And all this, even when the vein is rich, well developed, even and continuous. Very few metalliferous veins are equally rich for any considerable distance, either lengthwise or up and down; neither are surface indications always to be trusted. The consequence of all which is, a double quadruple uncertainty. On Lake Superior, a region supposed to be nearly pure copper, there have been hundreds of companies formed, and at least a hundred mines opened and worked, but it is a fact that for the first ten years of active mining there, but two of the mines paid a cent of dividend to the stockholders. Even in England, it is the opinion of the Keeper of Mining Records, Mr. Hunt, that excepting iron, mining for the metallic minerals is not on the whole, remunerative.

How impolitic and absurd then the proposition to tax the gross receipts of mines of this description, when in the process of development. The natural and unavoidable risks encountered, are quite sufficient to deter all but the most venturesome from risking their capital in such undertakings. The largest net benefit which could be derived by the government from such a course would be but trifling; while it would endanger a class of industry, which is of the most vital importance, not only to the government, but to the entire commercial and mechanical interests of the country. Its success will be the death-knell to all progressive mining on the Pacific Coast.

Short of Powder.—The Reese River *Reveille* says that powder is very scarce in that locality at present, and none but a favored few can obtain it at all. This scarcity comes heavy upon the miner. Many works have been compelled to cease operations altogether in consequence of inability to obtain powder for blasting purposes.

An Experimental Roasting Furnace is in process of erection at Austin, N. T., by the Isabella Company, for the roasting of ores. One of the objects of the company is to roast ores for experimental purposes, and for assaying them preparatory to their being sent to the mills for working.

Mechanical Department.

HOME INDUSTRY.

The mechanical progress and wealth of this city is, like its physical growth, wonderful and unparallelled. Our entire history, indeed, on the Pacific, has been and is still, in many respects, a wondrous romance, from which even the stern realities of mechanical art, usually of slow growth in all countries, are not exempt. In fact, I doubt very much, whether there is anything amongst us, connected with industrial wealth and progress, which partakes more of the Aladdin-lamp school, than the foundries, and iron-works of this city. Perhaps, a glance at that romance as it occurred within my own experience may not be out of place at the present time.

In 1849, a year almost as remarkable in the history of America, as the year of Independence, for it is held to be little less creditable to extend dominion, than to acquire it, I was one of the first half dozen who built a wooden shanty on the scrubby sandhills of Happy Valley, somewhere, I think, in the neighborhood of Geary and O'Farrell streets, which then was a long way out of town. With people in those early days, having an eye to a good future location, the great perplexity was to determine with anything like certainty, the direction the city would take. In spite of the old axiom, that all newly established seaports must "follow deep water," the character of the sandhills seemed to forbid the possibility of extension towards the south, while the high rocky hills at the north, seemed equally to forbid it in that direction. Nevertheless, that a great and powerful city was to spring up here, calculated in the end to wield a wondrous influence on the destinies of the American people, none of us doubted for a moment, but what vast amount of wealth and time it would consume to build that city up on such an inhospitable location, and amidst such terrible difficulties none of us could determine. During this important discussion, especially important to us who wished to make a good future location, the first fire came sweeping the entire block from the Plaza to Montgomery street, in less time, almost, than it would take a man to run round the space it occupied.

This calamity, together with the unsettled question referred to, strongly influenced the fate of thousands of the old pioneers. "Here we are" they would say, unable to make a safe location, with the certainty of being burned out every month or so for years to come; "let us go to the mines." So like fools we went by hundreds every day to the mines. What a grand mistake that was. We ought to have remembered, that the energy which brought us to this city, would surmount all the difficulties we might meet with in making it worthy of us. If we could dare and overcome the dangers of the desert and the ocean, defy the snowy peaks of the Sierra, and death-dealing malaria of the Isthmus, surely all the pigmy difficulties in making San Francisco, what late had predetermined her to be, the Queen of the Pacific, must yield as fully and as speedily to the same great spirit of enterprise.

So it proved. Our places were filled with men of a more consistent mode of reasoning, who never for a moment lost sight of this great fact; but on the contrary, bent all their energies persistently to its accomplishment. In a few years tidings reached us at the mines, that a thing called the *Steam Paddy* was cutting down the sandhills as fast as Charley Backus would gobble down apple-dumplings—that the Bay was filled up for half a mile—that Montgomery street was no longer the boundary of the ocean, but between it and the shipping stood several imperial streets, which in architecture, wealth, and extent would do credit to any country in the world—that away out south for miles it was all the same—that the old bleak dreary wilderness of sand was gone for ever, having through the agency of the Steam Paddy, given way to magnificent streets, palatial residences, exquisite gardens, and huge manufactories of every kind. Marvellous idea, we exclaimed; can all this be true, in a period so short? What fools we were to leave. Why could not that Steam Paddy have come to work sooner? How rich we also should have been. Well the opportunity was given, but not improved. We ought to have been faithful to our first California love. She had already realized our dreams; risen like a meteor in the fullness of the heavens' night glory; cast off her voice and depravity; conquered physical impossibilities; become in truth, the Queen of the Pacific; but then she had done all this without our aid, and so we had no share in the magnitude of wealth she showered so copiously upon her more steadfast and consistent friends. Perhaps, so far, it served us right.

Now all this sounds like romance. It is so in the strictest sense, and yet we know it to be a patent and veritable fact. In a single decade, we see the work of a century accomplished. To-day, three years later, we find nothing necessary to her happiness or prosperity omitted or overlooked. Commerce and religion, literature and charity, education and mercy, benevolence and science, amusement and pleasure carried out respectively to perfection. If, however, we have occasion to be proud of her busy marts, her churches, libraries, schools, hospitals, asylums, theatres, etc., we have equal reason to be proud of her mechanical wealth and progress. To illustrate the last is our present purpose. Here, then, in the haunts of Vulcan, we desire our readers to abide with us for a time, for here, as elsewhere, they will find our great city fully equal to her destiny.

It has long been an admitted truth that there are no institutions in any country so full of interest and instruction as its foundries and iron-works; nothing, at all events, which so fully shows man's wonderful skill and ability, or his marvelous dominion over the elements. To feel that interest, or receive that instruction, it is not essential to possess a mechanical knowledge which will disclose at sight the particular object of his labor. It is the absolute dominion of man we then witness over the elements and matter, which is so grand to contemplate. It is immaterial whether he is casting a monster cannon, such as belongs to the Camanche, or cutting a small, delicate groove in a steam engine, we shall be equally astonished at the ease and security with which he performs the one, as at the ease and perfection with which he performs the other. In truth, each department in a first-class foundry is in itself a school of instruction to both young and old, yet unless directed to these institutions by business, none perhaps, in any country, are so much neglected or overlooked. In California this is especially true. As a mining community we are more indebted to and dependent upon the perfection of our foundries and iron-works for our material wealth, than any other branch of industrial art; and yet how few of our citizens know the number of each in our midst, or in fact anything about them. To me, it seems we have nothing we can boast of with so much propriety and justice as the character, extent and perfection of our foundries and iron-works in general.

As the most important, we shall commence with the iron foundries. Those whose history we give first have not been selected in a spirit of favoritism, but simply because from them we obtained earliest the information required. Of iron foundries, there are ten in our city, the larger proportion of which may be termed first-class.

THE PACIFIC FOUNDRY.

This establishment, like most of our principal foundries, is located on First street, Nos. 127 and 131. It was commenced originally by Mr. Hinckley in 1851, thus forming one of the old pioneer firms. The firm is now known as Goddard & Co. The works have been enlarged at different periods, especially last winter, and are now extensive and complete. The number of hands employed is about 150. They consume, on an average, *every month*, in the neighborhood of 200,000 lbs. of iron for casting, 42,000 lbs. of wrought iron, 55,000 lbs. of boiler iron. Steam coal, 45,000 lbs.; forge coal, 20,000 lbs.; foundry coal, for melting, 130,000 lbs.; lumber for flasks, patterns and frames for machinery, 10,000 feet per month. They have three cupolas, which they estimate as capable of melting twenty tons of iron at once, so that here, as in other city foundries, they would have no difficulty in casting cannon as large as those of the Monitor Camanche, they being twenty-one tons. Few of our citizens suspect our foundries capable of such productions. The largest casting hitherto made in these works is a huge wheel for the Bensley Water Company, ten feet in diameter, and weighing nine tons. It is a finished and superior piece of workmanship. I find the rate of coal for melting is lower than I anticipated, being only one ton of coal to four of iron. Of course the works embrace every department in the trade, and enjoy a high reputation in our community. L. H.

[To be continued in our next.]

A SINGULAR DISCOVERY has been made in the Isle of Man, where it has been ascertained that certain old guns long used as posts on the quay at Peel, were rifled, Government has ordered them to be transported to Woolwich, where they are to be preserved as the earliest specimens of rifled ordnance.

A NEW RAILROAD SCHEME has been projected in Washoe, and professors Blake and Scott have started out to make a preliminary examination of the country lying between the Lower Crossing of the Truckee and the mouth of the Scott & Perigord Tunnel, Star Mountain, Humboldt mines, with a view to ascertain the practicability of connecting the two points by means of a railroad. If the appearance of the country is satisfactory they will at once proceed to make a careful survey of the route. The distance between the tunnel and the Lower Crossing is about 100 miles—from this city to the Lower Crossing it is about 35 or 40 miles. The great drawback to the mining operations in the Humboldt region is the almost total absence of timber for the use of miners, either for the timbering of mines or building of mills and houses. This difficulty they propose to overcome or greatly ameliorate by the construction of a railroad to the Truckee, down which stream timber and lumber will be floated from the wooded slopes of the Sierra. The Scott & Perigord Tunnel is a tremendous undertaking. It is intended to pierce through Star Mountain, in which there are known to be many rich leads, and will be, when completed, two miles and 526 feet in length. The tunnel is to be of grand proportions, its width being 10 feet and its hight 8 feet in the clear. The tunnel has been commenced.

MAKING STEEL FROM IRON WITH GAS.—About 25 years ago, Mr. C. McIntosh, a manufacturing chemist of Glasgow, Scotland, made several tuns of cemented steel by submitting iron, at a dull-red heat, to the action of lighted gas, operating with from 100 to 150 lbs. at a time, the iron bars being two inches broad and quite thin. The cementation took from eighteen to twenty hours, and when the operation exceeded that time supercarburation took place. Thus by the sole action of lighting gas, without mixture of any foreign body, it is possible to obtain either steel or cast iron; it is only a question of time or temperature. To obtain steel there is no need to add ammonia previously in order to nitrogenize the iron. Steel and cast iron differ only in containing diverse proportions of the same elements, as pure white cast iron can be tempered and even forged like steel; witness the white cast iron of Lieges used for making screw plates.

LARGE ENGLISH PLANING MACHINE.—Messrs. Losh, Wilson & Bell, Walker Iron Works, Newcastle-on-Tyne, have lately had delivered at their works an improved planing machine, adapted to plane marine engine cylinders and other work, up to 20 feet long, 9 feet wide, and 8 feet high, and which is fitted with four tool boxes, viz.: two in the cross slide and one in the front of each standard, all self-acting; so that, when an article is placed upon the table, they can be planing three sides of it at the same time, if it is required. This machine weighs about thirty-five tuns, and was made by Messrs. Francis Berry & Sons, Calderdale Iron Works, Sowerby Bridge, Yorkshire.

MINERAL CLAIMS FOR SCHOOL PURPOSES.—The late Territorial legislature of Colorado passed an Act entitled, "An Act to create a Fund for the Benefit of Schools." The law provides that one claim, of one hundred feet in length, designated as No. 3, on every mineral lode that should thereafter be discovered, "should be set apart and held in perpetuity for the use and benefit of schools in the Territory, subject to the control of the Legislative Assembly." It makes it the duty of discoverers to leave said claims vacant, informing the Recorders of their whereabouts; of the latter to record the same, free of charge, and deliver the certificates of record to County Superintendents of Common Schools. It is the Superintendent's duty, in his turn, annually to report the number and situation of such claims to the Territorial Superintendent of Schools, who shall recommend to the Legislative Assembly such regulations for renting or working the same as he may deem proper.

PHENOMENA.—On Sunday evening, May 1st, says the Alpine *Chronicle*, a brilliant flash of lightning was observed in the east; which brought out in bold relief the mountains which skirt the Middle Fork of the Carson, followed by several shooting stars which coursed through the heavens in an easterly direction. Not a cloud was to be seen.

GOV. NYE has issued a proclamation initiatory of a State Government for Nevada. The election is called for the 1st of June.

A California Barrel Manufactory.—The only barrel and stave manufactory on the Pacific coast is in Santa Cruz county, about ten miles north from the Santa Cruz mission. This manufactory was established in 1855 or 1856, by Mr. A. Glassel. A late number of the Pajaro *Times* gives the following description of the establishment:—

The motive power is an engine of thirty horse power; the machinery in use consists of one circular saw, jointer and plainer, a surface planing machine and two headers.

The oak trees are selected, felled, and the bark stripped off, which is used for tanning. The logs, in proper lengths, are transported to the mill, where, by means of the circular saw, they are cut into slabs four inches, and then cut by means of another saw to the proper size for barrels and half barrels, and so taken to the steam house, where they are steamed for twenty-four hours, after which the cylinder saw gives to them the shape and necessary curve to form a stave. They are then planed on the outside, and jointed on a small saw that adds the bilge and bevil, and in this state are tied up in bundles of eighteen each, ready for use, and are now called shooks.

The heads are made of half-inch pine boards, planed on one side, and cut to the proper shape and size by revolving knives.

The capacity of the mill is 300 barrels per day, and 1,600 heads. The extra heads are purchased by the coopers in San Francisco. The barrels described are used exclusively by the sugar refineries there. The mill gives employment to twenty men, and the amount of capital invested is $20,000. There are also made at this mill, staves for syrup casks—of fir instead of oak—being stronger and tighter; the latter produced in this State will not make tight work.

In the immediate vicinity of the mill there is growing a sufficiency of timber to supply demands for the next three years, when by moving to other timber tracts, within easy distance, new and larger supplies can be obtained.

This is the only stave and barrel mill in the State, and this county is the only part of California where can be found the necessary timber and position so as to make the manufacture of barrels profitable. This county has also large quantities of hazel, which furnishes the hoops, as also does the small sprouts of the oak.

The main supply of barrel staves for this State, has been and is yet by importation from the Eastern States—the manufacture of them here being a new enterprise, and without doubt, time will soon make it a very important branch of the many manufacturing interests of this county.

Influence of Flowers.—During the raid of Quantrell in Kansas, and the sacking and ravaging of Lawrence, the gang came to the residence of George Ford, whose neat house was surrounded with flowers. The soldiers appealed to their leader to spare the place as, "it was too pretty to burn;" he assented, and the house was spared, almost the only building left. Mr Ford says now he shall cultivate flowers as long as he remembers the rebellion. The charms of a few flowers touched the hearts of men whom no misery or suffering, in the midst of which they were reveling, could reach, and saved from destruction the house referred to. Who does not love flowers, and who will not devote even a little space to them. They refine, they elevate.

More Taxes.—The rate of taxes for Placer county for the current year was fixed by the Board of Supervisors at $3.40 on each $100 of valuation of property; but the Legislature having passed the bill guaranteeing the interest on $1,500,000 of the bonds of the Central Pacific Railroad Company, an additional eight cents on the $100 must be levied, as well as five cents more for a State School tax. In all, the taxes in this county will be $3.53 on the $100. From being the lightest taxed county in the State, Placer will be the heaviest burthened in that respect. The harvest for the tax-gatherer is coming. —*Exchange.*

Good Advice.—If the body is tired, rest; if the brain is tired sleep. If the bowels are loose, lie down in a warm bed and remain there, and eat nothing until you are well. If an action of the bowels does not occur at the usual hour, eat not an atom till they do act, at least for thirty-six hours; meanwhile drink largely of cold water or hot teas, exercise in the open air to the extent of a gentle perspiration, and keep this up until things are righted; this one suggestion, if practiced, would save myriads of lives every year, both in the city and country. The best medicines in the world are warmth, abstinence and repose.—*Journal of Health.*

Patent Department.

Patent Extension Schemes.—Most extraordinary exertions are now being made, by interested parties, to secure extensions of several well-known patents, the most prominent of which are the famous India-rubber patents of Goodyear, the Woodworth planing machine, Sherwood's Janus-faced lock and Fitzgerald's fire-proof safe. The first-named, the most valuable patent probably in existence, has already been twice extended and will become public property some time next month, unless Congress intervenes in behalf of that now powerful and overgrown monopoly. Goodyear is dead, having amassed an immense fortune, and his heirs and assigns have since amassed other fortunes. The people have payed quite enough for this invention, and should now have the full benefit of it. California, so far as consumption is concerned, is perhaps more interested in the matter than any other State in the Union, as an immense amount of rubber goods are consumed by our miners. The defeat of the present extension scheme will relieve Californians of an immense tax, which they are now paying to a wealthy monopoly, which for twenty years has controlled the prices of this description of goods.

The three last of the above enumerated patents have also been each extended, and are now rightly the property of the public. The utility and value of patents, and the propriety of affording proper protection to inventors of all important improvements, is fully and freely recognized; but it is not in accordance with sound policy or the spirit of our excellent patent system, to hedge up the field of invention by perpetuating patent privileges beyond a reasonable length of time. Such a policy is one against which the people have a right to complain, and upon which Congress should most emphatically set its seal of disapprobation.

A New Amalgamator—*A California Invention.*—We have examined the drawings of an amalgamator of quite a novel character, for which preliminary steps have been taken to secure patents by Mr. O. H. Taylor, of this city, the inventor, the working of which we will endeavor to describe as well as we can without an illustration.

The inventor claims the application of forcing the pulp through pipes into quicksilver, with the aid of steam direct, or its equivalent, compressed air, or by a pressure of steam or air on the surface of the pulp confined in tight tanks, as follows:—

In the last named manner, by the use of two covered tanks, placed near each other, and quicksilver bowls or receptacles, two in number, one for each tank, placed outside of the tanks, and connected with them in such a manner that when the steam or air is admitted to the tank that is filled and causes a pressure on its surface, it will cause the pulp to pass out of the full tank into the empty one through the quicksilver vessel by means of pipe connections, in small streams, so as to insure the contact of all the particles with the quicksilver. The pressure in the tank just discharged is then shut off or condensed, and applied to the opposite tank and the operation repeated as many times as may be found necessary. The pulp can be tested while the operation is being performed. In the process first referred to, by the use of steam direct through a pipe along with the pulp, the direction of the pulp is changed by a jet of steam, from one tank to the other through the quicksilver, by a simple apparatus placed above the tanks and connected with the steam generator.—Simple agitators are to be used in the tanks, if found necessary, to prevent the pulp from settling while being passed from one tank to the other.

It is estimated by the inventor that with the use of this application, ores can be amalgamated in a very short space of time compared with the present processes, especially gold ores that require no chemicals. He estimates that he can amalgamate a ton of gold ore, in suitable sized tanks, in less than one hour.

Debt of Sonoma County.—The outstanding indebtedness of Sonoma county is $34,000.

A New Magnetic Engine—*A California Invention.*—We had the pleasure, a few days since, to witness a small magnetic engine in operation—the invention of an ingenious machinist of this city. This engine involves in its construction many new and important features, by which many, if not all the hindrances heretofore met with in the way of constructing and running magnetic engines, have been overcome. Its inventor has had much experience in this direction, and feels the utmost confidence that he has now overcome all difficulties, and that he will soon be able to put in operation a machine of sufficient power to fully prove the value of electricity as a motive power. Letters patent will be taken out through the Mining and Scientific Press Patent Agency, for the United States and all the leading European countries. We shall have more to say upon this machine at an early day. We have much confidence in the belief that it is a valuable invention.

Hay-loading Machine.—Mr. William H. Bertley, of Westford, N. Y., has recently taken out a patent for an apparatus which may be attached to and carried along by the side of a hay wagon, and so contrived as that by driving the wagon along the side of a windrow of hay, the machine will gather it up, and by means of a revolving apron, carry it to the top of the load, where it is received by the loader and properly distributed, as when forked up. The machine rakes after itself, doing its work quite as clean and thoroughly as it can be done by a man to pitch it up and a boy to rake after, and much more expeditiously. The machine is worked by gearing attached to the wheels, upon which it is supported and moved forward. By the use of this self-loading arrangement, the farmer who trims the load can ride upon the same, and needs no other assistance than a small boy to drive, and the fatiguing operation of hay-loading, on a hot summer's day, is greatly lessened. The machine is highly spoken of. When not needed in the field it may be advantageously employed in the barn, as an elevator, to raise straw or hay to the scaffolds or mow above the floor.

Business in the Patent Office.—It appears from a report recently communicated by the Commissioner of Patents to Congress, that more business was transacted during 1863 than during any year in the history of the Government, excepting 1859 and 1860. The report states that 6,014 applications were made during the year, 4,170 patents granted, and 787 caveats filed. Considering the disturbed condition of the country, and the fact that no applications whatever could have come from a large portion of our territory during that year, this is certainly a most extraordinary exhibit of the inventive skill and industry of our people.

Type-setting Machine.—The type-setting machine recently invented by Mr. Felt, of Boston, according to the *Transcript* of that city, promises to prove a complete success. A company has been chartered to manufacture and operate the machinery. Several prominent gentlemen in the printing interest testified to the value of the invention, and the necessity of pushing it forward promptly. It has been testified by a practical printer, before the Committee on Manufactures of the Massachusetts Legislature, that this machine will "justify" type "more perfectly and uniformly than can be done by the ordinary hand process."

The Mountain Reservoirs of the Tuolumne County Water Company are now all filled. They are estimated to hold a four month's supply; and will not be tapped until the water fails in the Stanislaus, which will not probably happen until the last of June. The miners have thus a good prospect of steady employment until November, when another supply of water may be expected.

Great Inducements.—A New York stock-dealing firm advertises that they buy and sell shares of $100, $50, $25 and $10 in the Nevada, Colorado and Idaho silver mines, and that shareholders will receive their dividends in gold!

Artificial Limbs are now made of vulcanized India-rubber. As they are hollow, all the machinery is contained within, and is not liable to be deranged or broken. They are, it is said, much more readily made, and lighter than those made of wood or iron.

San Francisco:

Saturday Morning, May 21, 1864.

TWENTY-FOUR PAGES.—Next week we shall add four pages more to our paper, in order to give a full if not increased amount of reading matter, and accommodate our rapidly increasing advertising patronage. As our facilities increase we are bound to continue in improving the MINING AND SCIENTIFIC PRESS.

ANOTHER SHOCK.—Earthquakes in San Francisco seem to be increasing in both strength and frequency. Five or six shocks were reported on Friday P. M.—one, about six o'clock, being the most shocking affair of the season.

SECOND SHIPMENT.—The Golden Age & Empire Company last evening received from their works in Esmeralda, their second shipment of bullion—thirteen bars—amounting to $35,552 10.

THE ARTESIAN WELLS about San Jose, appear to be sensibly affected by the drouth of the past season, and fears are entertained least they may cease their flow altogether, before another winter sets in.

THANKS.—We are under obligations to Senator CONNESS, and to Congressmen SHANNON, HIGBY and COLE, for various public documents, for which they will please accept many thanks.

THE COPPER CONCENTRATING WORKS, in Salt Spring Valley, Calaveras County are said to be a perfect success. The principle is entirely different from any other employed for such a purpose, and has already been described in our columns.

FRUIT DESTROYED.—The Yreka *Journal* says that a severe frost, on the 6th instant, caused a wholesale destruction of fruit in that neighborhood. Apricots and peaches as large as cherries were frozen quite through.

TIN ORE.—Mr. Boyd of Calaveras county, went to Mexico some time since on a prospecting trip, and writes to some friends in Stockton from the interior of the State of Durango, that he has discovered an exceedingly rich tin mine in that State. He stated that sixty-nine pounds of ore yielded thirty-three and a half pounds of pure tin.

DEETKEN & CO.'S METALLURGICAL WORKS.—We paid a visit to this establishment a short time since. They are located on the San Bruno road, but have an office at 315 Montgomery street, in this city. This company has recently been incorporated, under the general incorporation laws of the State. They are prepared to undertake the reduction of ores of gold and silver, of every description, from several tons down to a few pounds; also to make assays. The establishment is fitted up with one large battery of four heavy stamps for heavy work, and several smaller ones for reducing a few pounds of ore for practical assays. The establishment is amply provided with Wheeler's and Varney's pans, large and small, also with an efficient arastra. The works are driven by a steam engine. This is the only company in the city who are prepared to conduct the chlorination process for the extraction of gold from auriferous sulphurets—the most thorough manner in which that difficult mineral can be treated. The process of calcination and chlorination was described in the MINING AND SCIENTIFIC PRESS for July 27th, 1863.

MINING SHARE MARKET.

The past has been the dullest stock week of the season. The total transactions of the boards, in mining stocks, have dropped to the low figure of $540,348 50.

Ophir has fully maintained its advance of last week, but with small business. Three feet were sold on Monday at from $1,175 to 1,190. A buyer at $1,200 was found on Thursday, but it finally closed at 1.160. The appearance of the mine is said to be improving.

Gould & Curry has still further improved. Closing last week, with holders at $3,900, a buyer at 4,000 was found on Monday. It subsequently dropped to 3,900, but again rallied and closed firm at 3,950. The improvements on this Company's mill are progressing rapidly, which, when completed, will materially augment the receipts of bullion from the mine.

Savage has still further receded, dropping from $2,050 to $1,800 at which latter figure we notice but a single transaction of three feet—the entire business of the week in this stock. Holders are now firm at $2,000.

Yellow Jacket still continues quiet. A single sale of four feet, at $800 per foot, comprises the business of the week.

Potosi has been but little dealt in. It commanded $975 on Monday, but dropped to $900 on Tuesday, since which no sales are noted. Holders were asking $1,000 yesterday. It is now pretty well ascertained that this company has fully 500 feet of good ground within their lines.

Chollar has again become quite active: 506 feet have changed hands during the past week. Up to Thursday afternoon it ranged from $520 to $560, when suddenly it went up to $600. Yesterday it touched $700, but closed at $650.

Burning Moscow has been more active but at a material decline—gradually receding from $76, its lowest figure of last week, to $53 cash, and $60 buyer 30 days before yesterday's board.

Pride of the West has been comparatively quiet at the closing figures of last week—$20.

Seneca has manifested considerable activity. Closing on Saturday last at $22, it has steadily advanced to $28 before yesterday's board. Upwards of 700 shares have changed hands.

El Dorado, which closed last week at the low figure of $26½, was not again heard from till yesterday when it still further dropped to $15, with a single transaction.

Uncle Sam sold at $720 on Monday, and found a seller yesterday at $700.

Lady Bryan has again become quite active, but at declining rates. Opening at $37, it dropped to $26 on Wednesday, but subsequently rallied, and closed at $35½. The present appearance of the mine is not very flattering.

North Potosi has sold at $78 to $94, closing at the former figure. Adriatic is quoted at $8; Baltimore American closed at $47 50: Bajazette is quoted at $26; Blue Ledge $17 50 to 20; Caledonia Tunnel dull at $18.

Baltic has met with a material decline from its last week's advance, and is now quoted at $65 to $67 50.

North American has still further declined. It closed last week at about $150, from which figure it has gradually receded to $110.

Buckeye maintains its last figures and is quoted at $12; Crockett, $10; Harmon has sold for $22 to $17, with but little request; Melones, $15; Central America, $10.

Golden Age and Empire has been quite active at prices fluctuating from $30 to $40, about 700 feet having changed hands.

Yellow Jacket has been heard from at $800; Daney at $80; Nevada J. G. at $78 50; Sacramento & Meredith at $50; Bullion at $75; Gen Grant, O. R., at $24; Sierra Nevada at $57 50.

Real del Monte still remains comparatively quiet. It has ranged during the week from $47½ to 57½, closing at 52. Another handsome shipment from this mine is elsewhere noticed. We quote Antelope at $180; Wide West from $22 @ 24.

A PONY EXPRESS LINE has been established to run between Star City, Humboldt, and the Boise mines, *via* Jordan creek. The road is well stocked, and the through trip will be made in forty-eight hours. Letters directed to Boise, *via* Star City, Humboldt, will be taken through by this line, Mr. A. B. Cutter and W. J. Westright, two enterprising and energetic gentlemen, are the proprietors.

W. A. HOLCOMB has been elected Recorder of Buena Vista Mining District, Humboldt county.

WASHOE STOCK MARKET.

Review of the Week Ending May 16th, 1864.

The apathy heretofore noticed in the Virginia Stock Market, still continues to prevail. The sales are light, and there appears to be but little disposition for business among either buyers or sellers. We give below the transactions which have transpired since our last report.

Allen has been heard from at $22, one sale of eight shares only being reported.

King Solomau has met with but a single purchaser who took 10 shares at $1¼.

Consolidated Brotherhood, 28 shares sold at 75 cents; Pony Express, 10 at $4; Golden Swan, 10 at $3; Combined Effort, 7 at $3½; Atlantic 10 at 3½; Rock Island, 1 at $20; Degroot, 15 at 50 cents; White & Saunders, 10 at $3; Milton, 1 at $30; New Oregon, 10 at $10; Napoleon, 20 at $6½; Effingham, 10 at 75 cents.

Harold & Argo has been less enquired after. Opening at $4, it declined to 2½ and closed at $3. Seventy shares were sold in four different transactions, within the above figures.

Jewett & Shepard still continues to form the chief feature of the Virginia market. A slight decline is noticed of about a dollar a foot, with sales of 160 shares, in twelve transactions, at from $27 to $29.

Dilligent has been sold—50 shares at $1 per share and 50 at $2; Leopold, 20 at $6 and 10 at $7; fully sustaining its last week's prices.

Knickerbocker has improved about $2 per foot. We note sales of 30 shares—20 at $35¼ and 10 at $35½.

Colorado has been in somewhat more demand, and at slightly improved rates. Sixty-five shares have changed hands at from $3 to $5.

Lafayette has met with two purchasers, one for forty shares at $7, another for 10 at 5.

Lady Bryan No. 2, which was not heard from last week, met with two purchasers on Thursday at $1½, advancing on Saturday to $3 and $3½.

Randolph met with an advance of $2 at first, but dropped to its old figure of $7½ at the close.

Seneca, which had been quiet for a week or two, was in demand on Saturday at from $19 to $24, closing at the former figure.

San Francisco opened at $6, a slight decline from last week, and still further declined to 4½ at the close; 85 shares changed hands between those figures.

Santa Fe met with two purchasers of 5 shares at $7, and 2 at $9; Yuba 2 at 2, and 135 at 2; Jenny Lind 50 at $1½ and 12 at $2; Champion 20 at 75 cents; Ohio, 50 at $1½ and 10 at 1½.

Gray & Cook opened with a sale of 5 shares at 80 and closed with 5 at 72½.

PIONEER STOCK BOARD, REESE RIVER.—The Reese River *Reveille* gives the following proceedings of the Pioneer Stock and Exchange Board, at their meeting on Monday, the 6th inst:

REESE RIVER DISTRICT.—Burrington, $10 asked; Eclipse, $12½ bid; Geo. Leet, $7½ bid, $10 asked; Mills, Post & White, $4 bid, $10 asked; Joe Lane, $7 bid; Isabella No. 2, $10 asked; Cox & Rose, $5 bid, $5 asked.

AMADOR DISTRICT.—Chapman, $5 asked; Monte Cristo, $20 asked; Wildwood Tunnel Co., $4 asked.

BUNKER HILL DISTRICT.—Brown, $15 asked; Real del Monte, $15 asked.

MISCELLANEOUS.—Fort Wagner, $15 bid, $15 asked; Stephen A. Douglas, $7 asked; Ontario, $15 bid, $20 asked; Rochester, $6 asked; Isabella (Eastern Extension), $5 asked; Mermaid, $8 asked; Union Flag, $15 asked; Holcombe, $5 asked; Die Vernon, $25 bid, $25 asked; Sinaloa, $8 asked; Mountain King, $6 asked; Southern Belle, $2 asked; General Grant, $10 asked; Mattagorda, $6 bid; Osceola, $10 bid; Diana, $25 bid, $25 asked; Cox & Rose, $6 bid; Scotia, $3½ bid; Apollo, $2½ bid—buyer 30 days—$2½ asked; Hero, $3 asked; Fort Wagner $20 asked; Yates & Yandle, $4 asked; Overland, $10 asked; Warner & Wells, $17½ asked; Beverly, $6 asked; Emma Funston, $6 asked; Marshall, $25 asked; Black Ledge, $7 bid; Stranger, $10 bid; Oregon (Buel location), $15 asked.

SALES.—Twenty feet Cox & Rose at $5 per foot; ten feet Fort Wagner at $15 per foot; ten feet Diana at $25 per foot—20 days.

Since the above date we have received reports of the following sales:

Ten feet Joe Lane at $10 per foot; five feet Old Hickory, at $20 per foot; 10 feet Maggie at $75 per foot, buyer 3 days. 20 feet Cox & Rose at $5 per foot; 10 feet Fort Wagner at $15; 10 feet Diana at $25, 20 days.

Mining Gossip.

EDITED BY.....FRANK WARDDELL.
FOR THE MINING AND SCIENTIFIC PRESS.

A Defaulter.—There has been much excitement among the higher circles of society in this city, during the past few days, together with much talk and a general "flattering," to say nothing with regard to the "high-colored" scandal that has also been rife—all about a youth, though young in years, yet old in ideas, who has taken unto himself a sudden exit to parts unknown. It seems, from all accounts, and they are many, as is usual on such occasions, that this gay and fascinating youth had run deeply in debt, and had not only exhausted his own money, but had also done away with a considerable amount of his employer's, in speculating in various mining stocks. The position he held in the house was that of book-keeper, which position he had occupied for a number of years, and was always looked upon as an honest, trustworthy young man. It is thought by many that there were some older heads working in connection with his in the many schemes in which he had participated. We know of several other instances where stocks have been the cause of luring the youth away from the paths of honesty.

Indisposition of Lady Bryan—During the past week, the many admirers and enthusiastic advocates of Lady Bryan were called upon to witness a gradual and unlooked for decline in this once important personage. Sad, indeed, have been the features of many brokers. Only to think, after their united efforts to keep her up before the public, and when under the impression that she commenced to show signs of improvement again, she suddenly has a relapse, and is now verging on the brink of the grave. There is a strong probability that our brokers will soon be called upon to exclaim, in mournful words, "Though lost to sight, to memory dear."

More Coal Discoveries.—A species of lignite coal has been discovered on Mr. Black's ranch, just west of Salt Spring Valley, a short distance north of Copperopolis. We have already reported the discovery of coal about twenty miles north of this locality, and in the same range. This discovery of coal in the immediate vicinity of our principal copper mines, is a matter of no little significance. Should coal be found there in any considerable quantity, it must add vastly to the importance and value of the copper interest. It is to be hoped that the discovery will be promptly followed up with proper workings for its development.

Lady Bryan Mining Co.—A letter received on the 18th inst., from the Superintendent, states, among other matters, that "the cross drift continues very hard, with favorable indications. The upper shaft is now down about 17 feet below the lower level, as shown on plan. From this shaft we have considerable water to raise, but not enough to hinder the work. Ore seems to be drifting westward; none of any amount at the bottom of the shaft. At a further depth of eight or ten feet we expect to drift into ore vein."

More Silver Discoveries in Connection with Copper.—By a letter from Knight's Ferry, we learn that bona silver ore—muriate of silver—has been struck in the Nellie & Julia copper mine, near that place. It is found only 60 feet from the surface, and a considerable distance above the water level. These repeated strikes of silver in connection with the copper ores of that section, are most significant, and may lead to early and important developments.

Good Run.—The Crescent mill, in Indian Valley, after a run of eight days, cleaned up over $9,000. Well done for Plumas county.

Petroleum.—The Santa Cruz Petroleum Company have two hundred gallons of refined oil ready for shipment to San Francisco.

Maxwell Creek Co.—A dividend of $1 per share on the capital stock of this mining company has been declared, and was payable on the 16th inst.

Creditable.—The employees of the Real Del Monte company, through their Superintendent, have paid into the Sanitary Fund $515.

Real del Monte.—Another shipment of $13,000 was sent from this mine on the morning of the 18th inst. Affairs continue favorable.

New Bank.—It is rumored that a party of capitalists have recently arrived here from the East, with the intention of establishing a National Bank in this city.

Utah Mining Co.—This Company, which is located on Silver Hill, Esmeralda, have their shaft down two hundred feet. The ledge is six feet wide. They are hard at work taking out rock, and purpose having it crushed at Winter's mill.

Dividend.—The California Building and Loan Society have declared a dividend at the rate of 1½ per cent. per month. This shows exceedingly well as to the prosperity of the association.

Truckee Ditch.—This ditch, when completed, will cost in the neighborhood of $40,000, and is under the control of a joint stock company, composed of wealthy ranchmen in and about the Truckee Meadows.

Carbon Coal Company.—The certificate of incorporation of this Company was filed on the 18th inst. The location is Fassett's coal mining grounds, Contra Costa county. Capital Stock, $240,000. Trustees, N. C. Fassett, L. A. Booth, A. Walrath, A. P. Bryton and Lennder Sawyer.

New Map of Virginia City and Gold Hill.—We have received from A. Roscnfield, 602 Montgomery street, a new map of Virginia City and Gold Hill, giving a clearly defined diagram of the Comstock lead, from the California Company's ground on the north to the Kohinoor Tunnel on the south, and showing the location of all the principal shafts and companies along the lead. It has been drawn on a scale of 500 feet to the inch.

Map of Owen's River.—We acknowledge the reception of a new map of the Owen's river mining country, from Mono lake on the north to Owen's lake on the south, showing distinctly the general topography of the country, all the roads and towns, and the principal stopping places. Most of the mines of especial note appear to have been carefully laid down, so that their particular localities and relative positions can be readily ascertained. The map must be of great service to all persons resident in or visiting that region. It has been carefully drawn from the most reliable information, by A. W. Reddie, and is published by Warren Holt, 305 Montgomery street.

Rich Ore.—A lot of rich ore has lately arrived in this city from the ledges of the Main Stanislaus and Melones Sink, in Calaveras county, adjoining and crossing Carson creek. Some time since we expressed an opinion that these ledges were on the gold belt of that locality, and we are now gratified to see such pleasing proofs of the correctness of that theory. There are only 1,700 shares in each Company, and the ledges free from litigation as to title and boundaries. If more attention had been paid in early days to security of title, many lawsuits might have been avoided. Neither of these companies have yet erected a mill; but if prospects continue only half as satisfactory as at present, it is their intention to erect one in the fall, or early part of next year, when their mines will be more fully developed.

The yield of thirty-seven silver mines in Nevada Territory, is estimated at $1,000,000 per month, of which the Gould & Curry furnishes $450,000.

The mining fever has reached West Lubec, Maine, and Philadelphia capitalists are going there to mine for copper.

Summary of Mining News.

CALIFORNIA.

Good Clean Up.—The Pennsylvania Company, located near Cayoteville, according to the Nevada *Gazette*, recently took out $1,664 from twenty-six tons of rock—an average of $64 to the ton. The rock previous to crushing realized $58 to the ton.

Cement Crushing.—According to the Grass Valley *National*, experiments at Red Dog, Iowa Hill, and other places, have demonstrated that the cement and gravel common to blue-leads, especially in proximity to the bed rock, can be advantageously worked by the crushing process. As a proof of confidence in this new source of mining profits, Mr. Edward Williams, of Red Dog, is now putting up a heavy mill for such work upon his claims. The hard cement in these extensive gravel deposits will not yield to the action of the heaviest hydraulic pipe yet turned upon it. If we are not mistaken, two or three mills of that description are already in operation in Nevada county.

Sierra County.—The *Mountain Messenger* continues to speak encouragingly of the yield of the mines in that vicinity, and in the southern portion of Plumas county.

In Siskiyou, Empire Creek, a tributary of the Klamath, is spoken of as a rich mining district. It is said to contain both placer and quartz mines. As high as $20 per day has been made in the placer diggings, and quartz lodes have assayed from $30 to $100 in silver and gold.

In Klamath, river mining promises to be carried on more extensively this summer than ever before.—Coffman & Co. have nearly completed their apparatus and machinery for raising water from drifting operations under Klamath river. Other operations, such as turning the river, bank drifting and quartz mining, are receiving a new impetus, as though good prospects are realized.

Tehama.—The Red Bluff *Independent* speaks confidently of the Elder Creek mines, and says there is "a world of copper in that whole section of country."

Mariposa.—The Mariposa *Gazette*, of late date, says:—"Some time ago, mention was made in this paper that a quantity of rock from Mr. Wm. B. Floyd's vein would soon be crushed in Deville's mill. They have just got through crushing twenty-three tons, which aggregated the neat sum of $1,392, or about $60 per ton. The above result is considered an average of the vein."

Mining in El Dorado.—A correspondent of the Union at Greenwood writes, under date of May 9th, as follows:

Hacket & Co., at the Spanish dry diggings, two miles and a half from here, have struck a rich seam of decomposed quartz, and have been digging it out by the pound—having taken out over six thousand dollars in the last few days—and still it continues to pay. Davis, Ross & Evans have just struck another seam of the same character about one mile from this place that looks like old times. The dirt appears to be half gold. They expect big things next few weeks. Miners that want to prospect can find plenty of indications without traveling over a sandy desert or a snow-covered waste to find them. If these claims were in Greenland instead of Greenwood they would be sought after by thousands from all parts of Uncle Abe's dominions.

Mariposa County.—The Mariposa *Free Press* says that considerable preparation in the way of fluming etc., with a view of extensive river mining this season, is being made on the Mereed at Smith's Ferry, and for quite a distance above and below that point.

A New Quartz Mill, having the capacity to crush 40 tons of ore per day, is in process of erection below Gold Hill, N. T. It is being erected by C. B. Land & Co, and will be called the Pacific Mill. It is on the east side of the cañon, over which a substantial bridge has been thrown.

WASHOE.

The Burnside is one of the oldest locations in Virginia, having been made in the winter of 1859-60. The peak of Mount Davidson is the center of this claim. The company have started four tunnels, two of which are still in progress; one, known as the "upper tunnel," is in 700 feet, and has followed along the ledge 200 feet, besides a drift running off on a branch ledge some 100 feet. The ledge is encased in hard granite, and is about 2½ feet wide. About two tons of rock from this tunnel have been crushed. The lower tunnel is still longer, and will strike the ledge about 200 feet lower than the one next above. The pay rock thus far taken from this mine has come

from exploring shafts and tunnels, and no particular attention has been devoted to it. The company are expecting soon to find good rock in their lower tunnel, which is now being driven through very soft ground.

A Subterranean Stream.—The tunnel of the Gilmore Company, American Flat, Says the Territorial *Enterprise*, is on the point of cutting a large stream of water. The tunnel is now in 525 feet and is fast approaching this stream, the noise of its waters being daily more distinctly heard. It is supposed that a large lead, as well as a large stream of water, will shortly be struck. The company have already passed through one lead of much promise, and should the one they soon expect to strike not prove satisfactory, they will go back and develope this one, their front lead.

The Jenny Lind is an old location, just north of the American Flat. The first tunnel commenced by this company was abandoned after running 200 feet. Two shafts were subsequently started and in time abandoned. A third was started in January last, which is still in progress. No drift will be run until the shaft is 200 feet deep, when it must be very near the ledge. Expectations are on the *qui vive* as to what will be found when they reach the vein with this shaft.

Napoleon Consolidated, located just west of the American Flat, has had considerable work done upon it, in various times, since its location in 1860, amounting in the aggregate to quite extensive mining works. The work in the claim, latterly, has been devoted to running a tunnel to strike the vein at a lower point than heretofore attempted, and is by far the most extensive of any work hitherto attempted in the claim. It is now in about 300 feet, half the distance through blasting rock. The tunnel is thought to be close upon the main ledge. Judging from surface indications the proprietors entertain strong hopes of striking a good vein. Rich developments are confidently expected in that vicinity at an early day, independent of this mine.

Best & Belcher.—There is still a large influx of water at this mine, making a steady use of the pump necessary, though it by no means requires the full power of the pump to keep the works drained.

HUMBOLDT.

The Sheba is still pushing its work ahead, employing forty hands. Large lots of first class ore is shipped to San Francisco for Europe. A new feature at this mine, says the Humboldt *Register*, is the sluicing apparatus, for saving small particles of rich ore. This employs a string of men and boys, who save thousands of dollars by assorting mineral from waste rock and putting it through the jiggers, to take off the earthy matter. This jigging business is not employed in any other silver mine in the Territory. Fifty tons of machinery for this mill were at Red Bluff on the 23d ult., awaiting teams. A contract has been made for the required lumber, which is to be delivered the 25th inst.

The De Soto.—Superintendent Fewell is getting out some ore for shipment to this city. A lot of ore was recently worked at the Star mill, after roasting, with a fine result, according to the *Register*. The metal cannot be extracted from these antimonial ores by any mill process yet introduced, without previous roasting. A tunnel will soon be commenced to strike the ledge fifty feet deeper than it has hitherto been opened. The old tunnel will hereafter be used mainly for ventilating purposes. Twelve men are constantly employed at this mine.

The United States.—A small lot of rock from this mine was put through a mill process some three weeks since, and yielded $210 to the ton. Mr. Root, who owns a large interest in this mine, has undertaken its management, and thinks he can make the work of development pay as it progresses. He has already several tons of ore out, which he thinks is quite as rich as the sample above mentioned.

Moonlight.—A large quantity of second class ore from this ledge, thrown aside when the work was in progress, is now being hauled to Fall's mill to be crushed.

Gem of Sierra.—A new ledge was struck in this claim about three weeks since, showing an abundance of metal of the same character as the old ledge. Seven tons were taken over to Lang Syne mill.

The Evening Star.—Two and a half tons of ore from this mine, was worked at Fall's mill a few days since, which yielded $1,000.28 in bullion—$400 per ton. The vein from which this rock was taken out is said to be well defined, and from 2½ to 3 feet thick. The Superintendent states that he will proceed, at once, to take out a large quantity of ore at this point.

MINING NOTICES—APRIL 30th.

Notice.—The Annual Meeting of the Stockholders of the Mountain Mary Gold and Silver Mining Company, will be held at the Office of the Company, 430 Montgomery street, San Francisco, on the third Saturday in May next, for the purpose of electing three Trustees. J. WARREN CLARK, Sec'y.
San Francisco, April 27th, 1864. 18-4t

Wide West Copper Mining Company, Stanislaus District, Calaveras county, Cal.

A STOCKHOLDERS' MEETING of the Wide West Copper Mining Company will be held at the office of the Company, No. 645 Clay street, on Tuesday, May 31st, 1864, at 7½ P. M., for the election of officers, and such other business as may come before it.
M. C. ELMORE, Secretary.
San Francisco, April 29th, 1864. 18-4t

Penn Silver Mining Company.—Notice is hereby given that the annual meeting of the Stockholders, of the "Penn Silver Mining Company," will be held at the Office of the Secretary, No. 411 Clay street, on WEDNESDAY, the 8th day of June, 1864, at 7 o'clock, P. M., for the purpose of electing a Board of five Trustees for the ensuing year. By order.
WM. FAULKNER, Secretary.
April 26 1864. (18-4t) Office, 411 Clay street San Francisco.

La Marronena Silver Mining Company.—Notice is hereby given that the annual meeting of the Stockholders of the La Morrenena Silver Mining Company will be held at the Office of the Secretary, No. 411 Clay street, on WEDNESDAY, the 8th of June, 1864, at 4 o'clock, P. M., for the purpose of electing a Board of Trustees for the ensuing year. By order.
WM. FAULKNER, Secretary.
April 26, 1864. (18-4t) Office, 411 Clay street, San Francisco.

Storm Cloud Silver Mining Company, Reese River District, N. T.

Notice is hereby given that in accordance with the by-laws of the Company, the first quartely meeting of the Stockholders of the Storm Cloud Silver Mining Company, for the election of Trustees, and transaction of other business, will be held, at the Office of the Secretary, No. 624 Montgomery St., San Francisco, on MONDAY, May 30th, 1864, at 3 o'clock, P. M. By order of the Board of Trustees
18-4t H. H. McCOUGHTRY, Secretary.

Bay City Silver Mining Company, Reese River District, N. T.

Notice is hereby given that in accordance with the by-laws of the Company, the first quartely meeting of the Stockholders of the Bay City Silver Mining Company, for the election of Trustees and the transaction of other business, will be held at the office of the Secretary, No. 624 Montgomery street, on MONDAY, June 6th, 1864, at 3 o'clock, P. M. By order of the Board of Trustees.
18 4t H. H. McCOUGHTRY, Sec'y.

Cortez Gold and Silver Mining Company, Cortez District, Nevada Territory.—San Francisco, April 28, 1864.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of April, 1861, an Assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the Company, 706 Montgomery street, San Francisco.

Any stock upon which said Assessment shall remain unpaid on the 2d day of June, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on the 20th day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
R. N. VAN BRUNT, Secretary,
18-4t No. 706 Montgomery street, San Francisco.

Mountain Mary Gold and Silver Mining Company, Silver Mountain, Alpine county, Cal.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held April 23d, 1864, an assessment of twenty-five cents per share was duly levied, payable in U. S. Gold coin, to the Secretary, J. Warren Clark, 430 Montgomery Street, San Francisco, (room No. 5, 3d floor), or to Council Goodell, Superintendent, Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the 28th day of May, 1864, will be advertised on that day as delinquent and unless payment shall be made before, will be sold on the 16th day of June, 1864, to pay the delinquent assessment and costs of advertising and expenses of sale. By order of the board of Trustees.
J. WARREN CLARK, Sec'y.
18-4t Office, 430 Montgomery street.

George Leet Gold and Silver Mining Company, Crown Point Tunnel and Mining Company, Reese River Mining District, N. T.

Notice is hereby given, that at a meeting of the several Boards of Trustees of said Companies held on the 25th day of April, 1864, an assessment of fifty (50) cents per share was levied upon the Capital Stock of said Companies, payable immediately, in United States Gold coin, to the Secretary, at his Office, No. 5 9 Clay Street, or to S. F. Ambler, at Austin, N. T.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 28th day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 15th day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
D. B. FRANCIS, Secretary.
18-4t Office, 509 Clay St., San Francisco.

Eureka Mill and Mining Company, Big Creek District, Lander county, N. T.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 25th day of April, 1864, an assessment of five ($5) dollars per share was levied upon the Capital Stock of of said Company, payable immediately, to the Secretary, or to R W. Brett.

Any stock upon which said assessment shall remain unpaid on Saturday, May 28th, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, June 11th, 1864, at 12 o'clock M. to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. N. DUPERU, Sec'y.
18-4t Office, No. 208 California St., San Francisco.

Tellurium Gold and Silver Mining Company, Pine Grove, Amador county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21st day of April, 1864, an Assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 23d day of April, 1864, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 21st day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 4th day of June, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees.
WM. H. MARTIN, Secretary.
Office, 627 Clay street, San Francisco. 17-4t

Grafton Gold & Silver Mining Company, Reese River Mining District, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of April, 1864, an assessment of thirty (30) cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold Coin, to the Secretary, at his Office, No. 509 Clay St., or to S. F. Ambler, at Austin, N. T.

Any Stock upon which said assessment shall remain unpaid on Saturday the 28th day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 15th day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
D. B. FRANCIS, Sec'y.
18-4t Office, 509 Clay Street, San Francisco.

Gobernadora Silver Mining Company, San Antonio District, Lower California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 23th day of April, 1864, an Assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 30th day of April, 1864, in United States gold coin to the Secretary, at the office of the Company.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 28th day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 11th day of June, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
C. W. HAYDEN, Secretary.
18-4t Office, 625 Clay street, San Francisco.

Lewis Consolidated Gold and Silver Mining Company. Nicolaus Gold and Silver Mining Company, Reese River Mining District, N. T.

Notice is hereby given, that at a meeting of the several boards of Trustees of said Companies held on the 25th day of April, 1864, an assessment of twenty-five cents per share was levied upon the Capital Stock of said Companies, payable immediately, in United States Gold Coin, to the Secretary, at his Office, 509 Clay St., or to S. F. Ambler, at Austin, N. T.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 28th day of May, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 15th day of June, 1864, to pay the delinquent assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees.
D. B. FRANCIS, Secretary.
18-4t Office, 509 Clay Street, San Francisco.

CAUTION.

Enterprise Gold and Silver Mining Company.—Location, El Dorado Canon, Territory of Arizona.

The public are hereby cautioned against purchasing the following Certificates of Stock of the above named Company, the same having been sold, by order of the Board of Trustees, to pay assessments delinquent—to wit:

Names.	No. Certificate.	Shares.
T. H. Williams	2, 4, 5, 7, 8	20, 10, 10, 30, 20
	10, 11, 18, 19, 20	20, 10, 25, 25, 25

L. B. WOOSTER, Secretary,
18-4t 622 Washington street, San Francisco.

Exchange Gold and Silver Mining Company, Reese River District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of April, 1864, an assessment of 25 cents per share was levied upon the Capital Stock of said company, payable immediately, in U. S. Gold Coin, to the Secretary, or to Charles H. Fiske, Austin, N. T.

Any stock upon which said assessment shall remain unpaid on the 4th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 22d day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the board of Trustees. C. W. M. SMITH, Secretary.
19-4t Office, No. 29 Gov't House, San Francisco.

NOTICE.

Is hereby given that from and after July 1st, 1864, the principal Office of the Savage Copper Mining Company Situated in Zinc House District Nevada County, California—will be in Lincoln, Placer County, California. A. BATEMAN, Sec'y,
17-1m Lincoln, April 18, 1864.

Mechanical.

REYNOLD'S

Patent Cut-Off and Governor,

For Steam Engines.

127 of these Invaluable Machines

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 75 per cent of the Fuel.

Steen's Improved Governor

IS THE CHEAPEST, SIMPLEST AND QUICKEST TO ACT AND least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, at the Stone Breaker, foot of Montgomery Street and at the Sugar Refinery, 8th Street, San Francisco.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., Etc., bought and sold the best market rates.

Anti-Incrustation Powder,

A sure remedy for Scale in Steam Boilers, without injury to the Iron. In use for the past EIGHT years.

☞ Machinery Made and Repaired. ☜

—Refer to—

Sugar Refinery, San Francisco,
Cottell & Co., San Jose,
L. A. Booth, Esq., Virginia City,
And 2,000 others in the United States.

E. T. STEEN.

I-tf Nos. 37 & 39 Fremont Street and 42 & 44 Beal Street.

MINERS' FOUNDRY

—AND—

MACHINE WORKS,

First street, between Howard and Folsom streets,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the Best and Most Economical, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

☞ Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

tf. HOWLAND, ANGEL & KING.

PACIFIC IRON WORKS,

First street, between Mission and Howard streets,

SAN FRANCISCO.

GODDARD & COMPANY,

—Manufacturers of—

STEAM ENGINES & BOILERS,

QUARTZ, FLOUR, SAW AND SUGAR MILLS,

AMALGAMATING PANS AND BARRELS, MINING PUMPS

AND HOISTING GEAR, WATER WHEELS,

And Machinery of Every Description.

Also furnish all kinds of Iron and Brass Casting. Only Manufacturers of the celebrated Bryan Battery. I4-tf

THE ATLAS IRON WORKS,

No. 24 & 26 Fremont Street.

—Manufacture—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangments will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

IMPROVED WATER-WHEEL,

—Patented by—

John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,

15v8-3m Golden State Iron Works, San Francisco.

Rock Drilling Machines.

HAND AND POWER ROCK DRILLING MACHINES, FOR SALE AT 25 PER CENT LESS THAN IMPORTATION PRICES, TO PEREMPTORILY CLOSE OUT THE ENTIRE STOCK.

Also, Second hand Presses as follows: One Hydraulic Press; One Screw Standing Press; One Lithographic Press. The above presses are all in good order. WM. W. DUNN.

19-1m No. 9, First Street, San Francisco.

PIONEER FOUNDRY and MACHINE SHOP,

18v8 California and Front streets, San Francisco.

To Druggists and all Prescribing for Neuralgic and Nervous Cases.—Your attention is called particularly to the efficacy of WATTS' NERVOUS ANTIDOTE for the above. Feelings of humanity, independent of pecuniary considerations, would prompt you to recommend it in all cases of Neuralgic Pains, Face Ache, from defective teeth, and the General Wasting Away and Debility of the Nervous System, if you could have the assurance that this was what it is purported to be—THE GREAT RELIABLE TRANQUILIZER AND RESTORER OF THE SYSTEM. It has been repeatedly prescribed in cases of excessive drinking, on the verge of Delirium Tremens, and even while laboring under its distressing influence, with astonishing results. It contains no preparation of Opium or Valerian, and is never accompanied with the unpleasant sensation always experienced after taking successive doses of them. It is also the best Soothing Syrup in use. Patients have taken Watts' Nervous Antidote many months in succession, and experienced no unpleasant effect whatever—while the same continued use of many other popular remedies has completely shattered the system.

For sale, Wholesale and Retail, by SAMUEL ADAMS, U. S. Drug Store, corner of Pine and Kearny Streets, San Francisco. 6v8-3m

Charles Hamilton	62	10	3 00
Charles Hamilton	63	10	3 00
Charles Hamilton	64	10	3 00
Charles Hamilton	65	10	3 00
		380	$114 00

And in accordance with law, and an order of the Board of Trustees, made on the 7th inst., so many shares of said stock as may be necessary, will be sold, at Public Auction, at the office of the Company, June 11th, A D. 1864, at the hour of 12 o'clock M., to pay said delinquent assessments thereon, together with cost of advertising and expenses of sale, unless sooner paid. Location of claim, Colorado District, El Dorado Canon, Territory of Arizona.

RODNEY CLARK, Secretary.

San Francisco, May 7th, 1864. 20-4t

NOTICE.

Is hereby given that from and after June 15th, 1864, the Office and principal place of business of the Emmett Copper Mining Company, will be removed from San Francisco to Copperopolis, Calaveras County. San Francisco, May 14th, 1864.

M. G. ELMORE, Secretary.

Office, 645 Clay Street.

20

Monitor District, Alpine County.

MESSRS. EDITORS:—Will you allow me a little space in your journal, (now acknowledged to be the best medium through which to reach all who are or wish to be interested in mines,) for the purpose of calling attention to this really interesting, and prospectively rich and prosperous mining region.

THE TOWN OF MONITOR

is situated in the very center of the mining district of the same name, eight miles south-west of Silver Mountain; Raymond eight, and Alpine three miles west; Markleeville, in Webster District, eight miles north-west; Mogul extending eight miles north and north-east, and including several thrifty camps; Silver King, a new but rich and rapidly populating district, ten miles to the south-east of us, are the other mining districts included in the new county of Alpine.

We are thus placed in the very center of population, with a climate unsurpassed in salubrity, free from those driving winds common along the larger water courses of the eastern slope; water and timber abundant. A company has been formed, and a ditch and flume nearly completed for bringing in the water of the creek from above the mines, thus ensuring to us even, after the opening of the mines, and the muddying of the creek here, pure water, limpid and sweet.

Business men and others seeking a solution of the question, "Where is to be the county seat of the new county of Alpine?" seem to have arrived at a legitimate conclusion, and are building rapidly.—Some two hundred buildings are already in process of completion, from the grading of lots to the finish of the structures. The lack of lumber is greatly felt, but several saw mills in addition to those already running, will soon be in operation, when it must be plentiful and cheap. But I am neglecting

OUR MINES.

As I first stated, they are prospectively rich. We that have for more than a year prospected and examined, need not that bullion be produced ere we arrive at a conclusion so hopeful. I confess that at this time, after so many have burned their fingers in mining operations, this conclusion is not sufficiently legitimate to enable us to bring capital to our aid in opening our mines. But if I am not very much mistaken, the signs of the times betoken an influx of seekers after pay rock; permanent ledges and advantageous locations cannot be withstood. We feel much confidence in the supposition that our mines are

ON THE COMSTOCK RANGE.

True, I may incur the risk of being deemed presumptuous, and my theory far fetched; but when I exhibit rock and ore that I know came from ledges here to experienced judges from Virginia and Gold Hill, not in one case but in hundreds they either accuse me of trying to "play" them with Gould & Curry, and pass on in a "huff," or like sensible men ask where it came from, and become the owners of feet therein. When, after finding the general course of the ledges here, I ascend Monitor Peak, compass in hand, and have pointed out to me Mount Davidson, and, upon trial, find this course to lead immediately to the great dividend paying mines thereabouts, I put this and that together, and cry, "Eureka."

I might mention innumerable assays and workings of rock taken out here, but this is already long enough, and as we have about twenty claims now being worked, and are to have an arastra, coupled with a Chili silver mill, in operation here by an experienced Mexican in a few days, I will delay particularizing until my next. MONITOR.

MONITOR, Alpine Co., Cal.

For Sale—A Useful Invention.—EDITORS PRESS:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a device of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-tf

RICHARD WEGENER,
Accountant, Mining Secretary,
AND GENERAL AGENT.
No. 204 Montgomery St., Southeast cor. Montgomery & Pine Sts.,
11-m SAN FRANCISCO.

MINING AND SMELTING COMPANY.—The California Mining, Smelting, and Beneficiating Company, filed their certificate of incorporation in the County Clerk's office on Saturday last. The object of the corporation is to carry on the business of assaying, smelting, and beneficiating ores by works to be established in the City of San Francisco, and for mining in California, Lower California, and Arizona Territory. The amount of capital stock of the Company shall be $1,500,000, divided into shares of $300 each. The principal place of business will be in San Francisco, but the Company will have a Transfer Office and Transfer Secretary in New York. The trustees are E. C. McComb, J. B. Crockett, Henry Sage, James Bowman, Charles Spencer, R. H. Waller, George C. Waller, Chas. H. Reynold, and Stephen Franklin.

Table Mountain Copper Mining Company.—Notice is hereby given, that the Annual Meeting of Stockholders of the Table Mountain Copper Mining Company, Stanislaus District, Calaveras county, for the election of Trustees, amendment of By-Laws, and the transaction of any other business that may come before the meeting, will be held, at the office of the Company, No. 645 Clay street, San Francisco, on Monday, the 13th day of June next, at 7½ o'clock P. M. M. C. ELMORE, Secretary.

San Francisco, May 21st, 1864. 21-1d

Summit Pass Gold and Silver Mining Company, Tuolumne County, California.

The regular ANNUAL MEETING of the Stockholders of said Company for the election of Trustees, will be held at Room 16, No. 528 Clay street, on the second TUESDAY of June, at 7½ o'clock, P. M.

T. B. LUDLUM, Secretary.

San Francisco, May 14th, 1864. 21-3t

Ophir of the Colorado Silver Mining Company, El Dorado Canon, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of May, 1864, an Assessment of two dollars per share was levied upon the Capital Stock of said Company, payable on the 17th day of May, 1864, in United States gold coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on the 18th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 2d day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. T. A. MUDGE, Secretary.

21-3t Office, 528 Clay street, San Francisco.

Joe Douglass Gold and Silver Mining Company, Reese River District, Lander county, Nevada Territory.

Notice is hereby given, that, at a meeting of the Board of Trustees of said Company, held on the 18th day of May, 1864, an assessment of 50 cents per share was levied upon the capital stock of said Company, payable on the 19th day of May, 1864, in United States gold coin, to the Secretary, or to the Superintendent, JOSEPH WHITE, at Austin, N. T.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 2d day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

ROBERT T. POLK, Secretary.

21-4t Office, No. 35 Government House, San Francisco.

Great Central Tunnel Company, Virginia City, Nevada Territory.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 17th day of May, 1864, an assessment of forty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to A. C. Nichols, No. 326 Clay street, San Francisco, or MELVILLE KELSEY Virginia City.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 18th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 6th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

21-4t MELVILLE KELSEY, Sec'y., Pro. tem.

The above Sale is postponed until SATURDAY, the 21st day o May, 1864, at 3 o'clock, P. M. By order of the board of Trustees.
L. HONIGSBERGER, Sec'y.

Peacock Gold and Silver Mining Company, Reese River District, Lander county, N. T.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of April, 1864, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately, in U. S. Gold Coin, to the Secretary, or to CHARLES H. FISKE, Austin, N. T.
Any stock upon which said assessment shall remain unpaid on the 4th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 22d day of June, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. C. W. M. SMITH, Sec'y.
19-4t Office, 29 Gov't House, San Francisco.

WASHOE MINING ITEMS.

New Paper.—Messrs. Degroot and Eckley are making preparations to issue a new paper at Ione City, in the new county of Nye, Reese River. The materials for the office have already been started over the mountains. The experience of Dr. Degroot will secure for the residents of that section a valuable paper, which will be good authority on all matters pertaining to the mining interest, in particular.

The Daniel Webster, which is located in Devil's Gate District, is taking out some rich looking rock. They are sinking a shaft down to the water level, which will be a great advantage to the working of the claim. A crushing of forty tons turned out $75 per ton. They are now working night and day, taking out quartz, and the Trustees have engaged a mill to crush 500 tons of the rock.

The Grenada G. & S. M. Co. are working steadily in their tunnel. An air shaft was put in last week, some 400 feet from its mouth. A perfect system of ventilation has been effected in this tunnel by extending a 6-inch pipe from the extremity of the tunnel to the bottom of a closed shaft, about midway of its length, after the manner already described in this journal, in our articles on ventilation.

The Silver Star have recently consolidated with the Kanaka Company. Their ground is to the west of the Oriental, in South Spanish Ravine. A shaft was sunk on the croppings 225 feet, and a tunnel started a short distance above the Oriental works, which is now in 500 feet. A shaft bas been sunk from the end of the tunnel, 60 feet on the ledge, finding it improving both in width and quality of quartz. Black sulphurets are making their appearance, and at the depth of 300 feet, to which the owners intend to go immediately, there is little doubt of pay rock making its appearance. The plan is to drift from that depth to the back ledges, put up machinery, and work the mine through the shaft.

Frankell Company is situated on American Flat, and contains 1,400 feet. It is marked by a tunnel which runs into the hill from a little ravine which crosses the road a little way beyond the Miantanomah company's works, 480 feet, as straight as a line all the way. The workmen have lately struck considerable water, and have found it necessary to put up canvas over where they stand to work. This water is considered a pretty sure indication of the ledge.

The Onkoto Co. is now finding very good indications in their tunnel, which is in about 480 feet.

Monte del Rey.—It is a source of much gratification to us to state that the above company has purchased a twenty horse power engine, for the purpose of working its claims. There is a spirit of energy being manifested by the Board of Trustees that is commendable indeed, we hope to see others imitate it. Mr. Aikin, the Superintendent, has taken a contract to build a mill near Dayton, and during his temporary absence A. Friedman will act in his place.—*Como Sentinel.*

Silver Discoveries.—The *Alpine Chronicle*, of the 7th inst., says:—"On Saturday evening last, John Poe, who has been employed by a company of Sacramentans, to prospect for them, arrived in Silver Mountain, having been successful in his undertakings, bringing with him a sack of specimens from a ledge which he has discovered on Silver creek, a tributary of Walker river, in Lost Valley district, about fifteen miles from Antelope Valley. The croppings were a dull, grey quartz, showing black sulphurets and galena. Good judges, who have examined the specimens, pronounce it the richest discovery of the season. Specimens taken out about two feet below the surface, look very rich in black sulphurets with less lead than in the croppings, the rock changing, in that short space, from the dull grey to a purer quartz. The ledge, so far as prospected, was found to be from 20 to 40 feet in width. This discovery is in a new district just formed, and is about thirty miles from Markleeville, in a southerly course via Silver King.

A Torpedo Corps."—The New York *Herald* of April 14th contains the following:—"The Navy Department has received from Admiral Porter a quantity of intercepted rebel correspondence, showing the existence of a regularly organized "torpedo corps." Some of the invention to be used are very curious; among them, lumps of coal, or something that resembles it, with torpedoes inside to be used with the fuel put on board our vessels.

MINING NOTICES—MAY 21st.

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 11v8-tf

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep21

WHEELER'S

Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same val, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

***These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

LLOYD'S NEW AMALGAMATOR

Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $40 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 600 pounds of tailings, the original ore having been worked by Professor Ryorson's Superheated Steam Machine, was obtained 15¾ ozs., Ryorson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold	$73 33
Silver	42
To the Ton	$73 75

The assay being made by Messrs. Molitor & Co.

From 20 pounds of the same ore, worked for the same party, was obtained:

Gold	$63 30
Silver	04
To the Ton	$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 34 per ton; and over the works at the mill, $62 34 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $6.19, Silver, $1.52, amounting to $27.71-100—equal to $361.33-00 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $'54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.

Result of 65 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2.76.48-100. Assay made by Messrs. Molitor & Co. 100 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58-100—equal to $111.60 to the ton. Difference in favor of Lloyd being $64.53-100 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying, or other machines, can be addressed to the care of Messrs. Kustel Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by the general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.]

And in accordance with law, and an order made by the Board of Trustees, April 20th, 1864, so many shares of each parcel of said stock as may be necessary will be sold, at the office of the Company, on the 9th day of June next, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, No. 5, 3d floor, San Francisco.
San Francisco, May 21, 1864. 21-2t

Caledonia Tunnel and Mining Company, Office, No. 10, Government House, San Francisco, May 17, 1864.

Notice is hereby given, that in accordance with the laws of the State of California, and an order duly made by the Board of Trustees of the Caledonia Tunnel and Mining Company, as required by the By-Laws of said company, there will be sold at public auction, to the highest bidder for cash, in United States Gold Coin, on SATURDAY, June 18, 1864, at 11 A. M. of that day, at the salesroom of Messrs. Jerome Rice & Co., No. 327 Montgomery street, San Francisco, so many shares of the capital stock of said company, standing in the name of the following person, or shareholder, as will be necessary for the payment of all assessments duly levied thereon by the Board of Trustees, and delinquent, together with the expense of advertising and sale:

Thomas Sunderland, Administrator of the Estate of H. O. Gaylor. No. certificates—592, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621....200 shares.....$2114 50

By order of the Board of Trustees.

21-4t J. M. BUFFINGTON, Secretary.

Two Good Canvassing Agents can find profitable employment by calling at this office. None but active and competent need apply.

Wilson Gold and Silver Mining Company.--Location, Echo District, Humboldt county, Nevada Territory.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessments duly levied by order of the Board of Trustees, on the first day of October, 1863, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amt.
H. G. Blasdell	not issued	300	$300 00
J. W. File	not issued	300	300 00
Abner Wade	17, 18, 19, 20, 21, of 20 shs each.	100	100 00
Abner Wade	23, 24, 25, of 10 shs each.	30	30 00
Abner Wade	26, 27, of 5 shs each.	10	10 00
I. N. Thorne	not issued	75	75 00
Robt. J. Fulton	1, 2, 3, 4, 5, of 10 shs each.	50	50 00
Robt. J. Fulton	6, 7, 8, 9, of 25 shs each.	100	100 00
E. C. Palmer	33	bal due on 37½	28 15
C. A. Uhrig	47	37½	37 50
Thomas Mulcahy	32	5	5 00
Arthur Haine	36	12	12 00
John Pullee	101	10	10 00
D. P. Winne	102, 103, of 25 shs each.	50	50 00
Edward A. Morse	110	10	10 00
H. F. Nettleton	61, 62, 63, 64, 65, of 10 shs each.	50	50 00
J. C. Hanson	79, 80, 81, 82, of 50 shs each.	200	200 00
C. M. Batchelder	10	10	10 00
Mrs. E. W. Carey	11	10	10 00
Emma Patten	13	10	10 00
John Brennan	14	10	10 00
Mrs. E. A. Baxter	15	10	10 00
D. H. Kinsey	16	20	20 00
John C. Ing	83	10	10 00
R. G. Carlyle		60	60 00
S. Tyler		120	120 00
B. C. Whitman	75, 76, 77, of 25 shs each.	bal due on 75	40 00

Therefore, in accordance with law, and an order of the Board of Trustees, made on the 2d day of May, 1864, so many shares of each parcel of said stock as may be necessary will be sold, at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on SATURDAY, July 2d, 1864, at 12 o'clock M., of said day, to pay said delinquent assessments (one dollar per share) thereon, together with costs of advertisement and expenses of the sale.

J. F. MILLER, Secretary.

Office, No. 416 Washington street, San Francisco.

N. B.—Payments may be made at any time before the 29th day of June, to A. GAUCHAT, at the mine, or to the Secretary, at his office in San Francisco. (21-td) J. F. MILLER, Secretary.

Refugio Mining Company, Jesus Maria, Chihuahua, Mexico.

Notice, there are delinquent, upon the following described Stock, on account of Assessment levied on the 13th of November, 1863, and the 9th day of February, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shs.	Am't
Assessment No. 1.			
Davidson, L	100	60	$600 00
Martin, A	101	20	200 00
Assessment No. 2.			
Campbell, Roht	3, 93, 94, 169	53	$530 00
Cahill, Ed	13	10	100 00
Burstell, J. M	22, 70, 85, 86, 89, 138, 142, 7	92	920 00
Davidson, L	100, 160	72	720 00
Eastman, C. A	105	100	1000 00
Martin, A	101, 161	24	240 00
Malloy, John	88, 91	25	250 00
McKean, A. C	114, 123	6	60 00
Mowry, Sylvester	16	63	630 00
Smyth, C. F	40, 87, 159	50	500 00
Webb, C. H	155	50	500 00

And in accordance with law, and an order of the Board of Trustees made on the 18th day of May, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction on the 21st day of June, 1864, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

COLL DEANE, Secretary.

21-4t Office, Odd Fellows Hall, Montgomery st., San Francisco.

Tellurium Gold and Silver Mining Company, Pine Grove, Amador county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 21st day of April, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

The Patio Amalgamation.

BY J. H. CHURCHILL, A. M.

[CONTINUED FROM PAGE 323.]

It will bo desirahle to describo the treatment of the ores from the month of the shaft, hecanse in estimating this process ns the foundation of others, it is well to know exactly where the alterations introduced really arise. The want of the same capital which has given hirth in our State to "freezing out," drives the trihuter in Mexico who has heen working mines on shares to the display of his oro in a court yard. There he offers them by anction to the tender mercies of huyers, whose interest in the ores is ahsolute from the moment of sale, and from whom it were hopeless to attempt to lenrn nnything which might guide the original owner as to the real value of his commodities. On one side we havo an ignorant peou, rclying on the hrightness tnnt he can develop by constant wetting—on the other, men who werc satisfied origiually with such au approximation, as panning out wonld nfford, nnd who found sufficient security in the nvarice of their compeers, that they would never he required to give full value for nny nres—competition has more lntely induced them to attempt an assay hy cupelling a small piece of a lot for sale, hut still with the rudest, if not unpracticed guessing, instead of sampling. Do we do hetter?

Those who have heen "frozen ont," and who hnve lost all their "feet," will hardly call this peculiar alteration in the modc of getting value for a claim which requires the same sort, and the same proportion of capital from the moneyed mnn and the working man, an equality worth maintaining. Try again, legislators. In any ease a proper sampling ean alone enable a huyer to offer up to the full value; any speculative purchase must, in fairness, be against the seller of nn nrtiele ahove the average standard. The ores that have thus bcen collected and sold are often in very large masses—it is even said that expericnced buyers weigh these by the eye with considerable accuracy, sufficient doubtless, to protect themselves—like other guesses of the same loose kind, they are aecurate until they are verified; their only merit is, that they can he madc quite "safe." Alas! for the careless seller.

These masses are first broken np and transported in sacks to the hacienda of the purehnser on mules. These animals nlso supply mueh of the power reqnired for working the stamps and the eireular mills for grinding, ns well as for treading the torta. They end by being filled up with amalgam, so that they are never quite worth their weight in pure metal.

The whole system of pulverization consists of three snceessive operations in the stamp mills, which are of mueh the same eonstruetion, as the non-revolving stamps of Cornwall and other countries, followed hy grinding in stone mills, nnd this by treading with horses, mules or men. Between the first and seeond operations, the ore is sorted hy passing it through a perforated hide; it is then nsually in tho eondition oe coarse sand. Six mules will work a ten-stamp mill for six hours, and pulverize ore iu that time to this degree of fineness at the rate of half a ton per hour. The next process is conducted with eonsiderable difference, in the result—in some, 800 lbs. per 24 hours are reduced. In the case of horu silver, much of the subsequent sueeess depends upon the carefulness with which this tough mineral is comminuted; where the finest work is necessary, six hundred pounds per day of continuous grinding is a full charge. Two mules work one arrastra commouly for six hours.

In addition to this reduction in size of the mineral, in some cases roasting, even of the argentiferous ores, was resorted to. Thus we find blendes roasted in furnaces of the reverberatory class. The heat was necessarily low from the nature of the materials of construction, iu addition to the cost of fuel; and ns the result it often occurred that after twelve hours' operation, much of the sulphurets still retained their natural lustre.*. Again, as nt Nieves, open furnaces were used, and the roasting effected on the same principles, as when (copper) coarse metal is roasted in stalls, as at Mansfield. The furnace was made as broad as high; the charge consisted of ahout a ton of ore with half its weight of dried wood, so elosely packed that the mouldering ignition was maintnined for a week. The material of this furnace was also adobes. This method of roasting is in any eircumstances incomplete, and we shall see that in heing one source of the introduction of sulphurets of hase metals, among the materials of the torta, it is answerable for much of tho enmplications of the whole system.

It is not unworthy of remark that at Stern, when roasting hlendes in the most improved method, where they nltimately by the nse of a high heat, remove all the sulphur, only twn-thirds are removed as sulphurous acid.†

We have now the ore reduced in size, and where necessary roasted, and it is ready for heing introduced into the cake-shaped heap, or torta, for amalgamation. The other materials are essentially magistral and salt. The first contains, as an active ingredient, sulphate of copper, or part of the sulphuric acid may be comhined with iron. It is prepared from pyrites hy roasting, nnd ns in the case of the similnr treatment of the ore, the proeess is hut imperfeetly performed in general, and we have ngain a residue of snlphurets to go into the torta; and when this is the cnse, of course the heat npplied has not heen sufficient to decompose the sulphate of iron. The salt is added, as we shall see, separately; but it was n practice long sinee known in Mexieo to intrndnee a small quantity of it while roasting the magistral. There seems, therefore, less originality than a recent writer, on Californin processes, implies when he is spenking of roasting pan-tailings, to supply magistral for patio amalgamnting at Virginia City and on the Carson river. They were essentially sulphurets, also containing some common salt. The sulphate of eopper, present in the magistral, as prepnred by fire, has an important distinction from blue vitriol; it is free from water. Wben, tberefore, it is added to the water in the pntio, it eombines with it, nnd the heat so produced is nt least to he considered in tbe history of the process. When this is rendered tardy hy the presence of too mueh magistral, it is attrihnted to heat, and termed ealor; similar sluggishness in eold weatber is ealled ealor de frios. We shall have to notiee tbe ehemical effect of mass on the materials of the torta. It is partly owing to mechanical ineonvenienes, attaehed to the hulky salt earth of Penon Blanco, that its employment was ahandoned at Zaeetecas; hut it is quite certain that it was a prolific souree of waste during all the time it was put into the torta. It eontained by analysis‡ less than 20 per eent of salt; but it also intrndueed along with this two-thirds of the same proportion of lime and magnesia in the form of earhonates. It will be apparent, as we proceed, how nngatory sueh a mnterial must have heen. A ehemist may he exeused in pointing to this mnrked instance of the money value of his sciene. An assny determined that there was salt enough—the analysis, that there was enough else present to make this nenrly nseless—a result only to be learned without it by mnny repetitions of mnny months' work.

[To be Continued.]

THE BRITISH METAL MARKET.

Tho British Metal Market was exceedingly dull during the month of March, with prices generally tending downwards.

TIN.—The standards for black tin were reduced, during the month, £6 on fine and £7 on commou. A fall of £4 was announced on the 17th. From that date to April 1st the market was firmer. Straits in demand at £112; Banca at £116@117. Tin plates in demand at fair prices, according to qnnlity. The *West Briton* remarks that this decline is no more than every one had heen expecting for some time. This drop in the standard will materially effect the tin mines, and throw them back to the same position as they were at the heginning of the year.

COPPER.—Sales of copper, at the Cornish Ticketings, for the four weeks previous to Mnrch 20th, were 13,124 tons, with an avernge of 6 per cent.; standard of value, ahout £131.

LEAD.—The prices for the month of March show n slight decline over that of February. Common English is quoted at £21¾; L. B., £22; W. B., at £22¾; Spelter, at £21½.

IRON.—The market for this metal has also heen very flat, orders having been kept back in hopes of a reduction in prices. Some improvement was manifested townrd the close of tbe month, and a fair business was done in Seoteb Pig at from 58s. 3d.@ 59s. 6d. Sweedish iron has been better maintained.

The same general depression is noticed in the various continental markets, The disturbed political eondition of Europe is assigned as the cnuse of the depression, and bnt little improvement can be expeeted until polities present a more favorahle aspect. Operators and eonsumers, in the meantime, will use great caution in all their transactions.

A MINING SHARE SALE IN VICTORIA.—The Victoria *Chronicle* tells as follows how British Colnmbia mining shares sell: J. P. Dnvis & Co. yesterday sold by auction 155 feet in the American Mining Co., Gold Strenm, at 67½e. and 45e. per foot; 119 shares Sangster Copper Co., at 35c.; 10 feet in the Parmenter Quartz Mining Co., Gold Stream, at $1 per foot; Eureka Copper Co., 25e. per foot.

SCIENTIFIE EXPEDITION.—FRANCE is preparing a Scientifie Expedition to Mexico on a magnificent scale. The Minister of Public Instruetion has nominated a Commission to prepare and instruct this phalanx of savans.

MAMMOTH ELEVATOR.—A Mnmmoth Elevator is in proeess of eonstruetion in Milwaukee, which will have a eapacity of 1,300,000 bushels; nine receiving and five shipping elevators, with 45,000 hushels taking and 25,000 giving capaeity per hour.

A NEW PAPER, devoted to the cnuse of spiritnalism has been started at Sacramento, ealled the Golden Gate and edited by Mrs. Frances H. McDongal.

THE FORMATION OF METALLIC VEINS.

NUMBER V.

BY EDWARD A. MILES.

Water, which in a pure state is a great obstacle to the passage of electrical currents, is a superior conductor of them when united with acid, alkaline or metallic elements. Springs are almost always found issuing from or near metallic veins, and are usually heavily mineralized with alkalics, sulphur, and sometimes the more poisonous metals. Water, whatever form it may take, is the grand vital agent of the electrical action in veins. It is equally required in the chemical changes, the electrical conduction and the transfer of elements. Some kinds of rock, when in place, have a high degree of aqueous saturation, and, perhaps, others, to a more subtle and greater extent than is really supposed, through the powerful capillary attraction that electricity is known to exercise. In more favorable mining regions it will be found that high mountains are the absorbants whence erupted dykes act as conduits and limiting walls to convey the internal drainage of a large area into a comparatively small basin, where the richest mines flourish like the verdure of an oasis. The operation is the same in analogy with that of external streams concentrating loam and fertility. Metallic veins outside of these conditions have a far less degree of richness, and where numerously diffused within a small space, are individually less pregnant in proportion. Even the central areas of the submerged basins of certain geological epochs seem to now bear the most bounteous metallic character, whether but little disturbed or greatly elevated and broken by intruding rocks. The great thickness of their strata gives that powerful and extended working of the electrical cause not to be obtained in rocks of a shallow depth. The geological basins are traceable in unaltered sedimentary formations, and are surmisable amid metamorphosed rocks throughout the world. The lead mines of Illinois and Iowa and the mines of California appear to occupy the inner areas of such primeval basins. It is also noticable, that all superior mining districts, whose containing mountains or hills are physically insignificant, are either located near the sea or large inland bodies of water, which must be supposed to exercise some influence in the electrical effects.—Types of this latter class, are the mines of Great Britain, Norway and Lake Superior.

That vigorous action witnessed in a galvanic battery, and in a moment setting free the electricity that nature has been hoarding during centuries, must far exceed the full power of the largest quartz lode. It is thus that nature weaves the atoms of every fabric, by feeble means in perfect control; her most compact and perfect structures are the result of slow, progressive creation through time, wherein the life of man is among the lowest fractions. There are metallic veins that, by all geological calculations of the age of the stratified rocks, may date back their birth and electrical excitation millions of years; in all that immensity of time, gathering, atom by atom, the aggregations of those coins that ye men of mental and physical labor have toiled for but a day, an hour, or a minute!

The requirements of constant workable metallic veins are so complex in character that it will be seen that they ever must be rare, and when found, prized like jewels of great price. The largest class of metallic deposits, upon which modern speculation sinks the equivalents of as much money as ever comes out of the good ones, are segregated veins that have been in their imperfect fissures but slightly or irregularly operated upon by electrical action, a fact that might have been anticipated prior to any great expenditure of money. Others again hold their contents gathered within a few rich but scattered pockets. Yet many of both these classes can be rendered profitable through a true knowledge of their character.

A metallic vein is to the mineral what a tree is to the vegetable kingdom, having its roots, and its branches, and its precious fruits; both throb with currents electrically and chemically comparative in character, and revolve the valuable disseminated particles of nature in condensed forms. The one marshals the inorganic and the other the organic elements into combinations of beauty and of use to mankind. The diurnal revolutions of temperature, the electric shafts hurled from the collossian thunder cloud, the gentle falling rain drops, the changeful breezes, as well as the living spring, are all co-workers of the subtle but mighty labors.

[Concluded next week.]

[Written for the Mining and Scientific Press.]

From a Special Correspondent.

Messrs. Editors.—Records of journeys over well traversed pathways and among scenes and actions not altogether striking to the familiarized traveler, can demand nothing more than a dry statement of the existing state of things; and this is all I will promise as the imparted instruction of the present brief tour, which commenced with my departure from Sacramento by the Jackson road, one day last week.

A ride of twenty miles brought me to the old Dayton ranch, whence my course led up the Cosumnes river to Michigan Bar, crossing the stream at Putnam's bridge, three miles below town. No finer rural scenery than strips of the river bottom, green with barley and broadly shaded with oaks, can be found in any portion of the State. Back from the little stream, designated a river, green fertile nooks and fields occupy the hollows and low hills as if seductively clasping the brown hills in their charming embraces. Barley here and elsewhere along the foot hills seems to be the favorite crop, and at a casual glance looks better than its prospective yield of grain really betokens. Before reaching the river the last few miles of travel were over an area of gently rolling country, but from that point the view recognizes the flat-topped hills that mark a range of gravel deposits and its cement cropping. At different points, I examined three varieties of this cement, the first met with being a shallow, gray, taffaceous mass, enclosing pieces of trachyte and impressions of leaves, the second a light calcareous bed, and the third a stratum of coarsely cemented quartz grains. To the decomposition of the two former varieties is probably due the general fertility of the surrounding soil. Three miles below Michigan Bar, a dyke of serpentine rising above the level of the adjacent land, crosses the river, where it conveniently serves to anchor a wire bridge, high above destructive floods. I heard of but one attempt at copper mining in the vicinity of this belt—on a thin seam of pure metal, which eventually gave out. Succeeding the serpentine, comes ranges of hills, extending close to the river, and covered with a red loam, which is being washed down in many places to the depth of forty feet by such hydraulic facilities as can be afforded by streams heading from the level of the hills.

The small town of Michigan Bar occupies a flat, curving back an half mile from the river, which here makes a long bend in line with the curvature of the flat. The wide bar on the opposite side of the river is receiving attention from but one small company of Chinamen, while a narrow place along the banks at the lower end of the town still remunerates a large number of the same class of miners. The river is so shallow here that but little effort is required to turn its course.

In a ravine on the west slope of a ridge, a mile below the town, I visited the ledge of the Josh company, which has been sanguinely located as an argentiferous vein. It embraces a seam of white quartz, about one and a quarter inches wide, between walls of black slate, which are flanked by a gray clay slate. The quartz and walls are impregnated with iron sulphurets, and, possibly, other metals which I failed to detect. The shaft has been sunk to the depth of seventy feet. About three hundred pounds of quartz and wall rock was shipped below on the same day for a thorough working test, awaiting which work has been suspended on the shaft.

Crossing a rude bridge, east of Michigan Bar, and thence over a nearly level tract of country to the succeeding ridge, in all, a distance of five miles, I reached the copper belt and the claim of the Cosumnes company, one of the most notable of the vicinity. The Cosumnes company's vein is situated near the top of the ridge. The claim, located in December, 1862, contains 10,100 shares, of two feet each. The principal shaft, connected with an engine and costly building, has reached the depth of 280 feet. Starting at the surface, a good body of ore was followed down to where it became quite pinched, which caused a wide spread report that the vein had entirely failed; deeper sinking, however, brought another deposit of ore, which for the last sixty feet has not given more than slight traces of its presence.—The rock being hoisted at the time of my visit, contained considerable white quartz, with occasional pieces of mundic and sulphurets of copper. A second shaft, 290 feet south-east, had reached the depth of eighty feet with two drifts of forty-five feet total length, at the bottom. The rock near the surface is intermingled with green carbonate of copper; below and in the upper portion of the drifts there is exposed a considerable bulk of sulphurets, evidently of a high per centage, showing the mark of the pick point almost like pure metal. The amount of ore taken out of this shaft is said to average two and a half tons of No. 1 sulphurets per day. In all, over 300 tons of ore, averaging near twenty per cent. of metal, have been shipped from the mine. Twenty-five men are said to be employed about the works. In addition to the returns from the ore, the outlays have demanded assessments amounting to some $21,000. Near the present shaft, quite large blocks of sulphurets and red oxides were early found at the surface. Two other portions of the Company's lengthy strip of ground have been pierced to a slight depth without finding workable ore.

The Spanish Co. (incorporated), claiming 3,200 feet on a parallel vein, at the foot of the hill, west of the Cosumnes, has two shafts, the deepest thirty feet. South, on an extension of the same vein, are other shafts, averaging a depth of thirty feet. A third vein appears to lie still further west, on which is located the Badger Co's claim, with a shaft twenty-eight feet in depth.

Claiming on a vein, east of the Cosumnes and a short distance south of the shafts, is the Oriental company's ground, of 1,400 feet. This claim possesses a half dozen shafts, the deepest 125 feet, with a good building over it. From this claim two or three lots of ore have been shipped; the last amounting to twenty-five tons. Work, for a time suspended on this claim, has been re-commenced.

Next south is the ground of the Oriental No. 2; 2,000 feet, shaft 45 feet. Succeeding it on the same vein, the Katrina company claims two thousand feet, and has a shaft down eighty-three feet. Still south, is the Malachite company's claim, on another vein.

The two last named claims belong to San Francisco companies, and are being prospected under the supervision of Mr. Schütze, who is about to publish a lithographic map of the copper claims of this section. According to his estimate, there are some seven or eight parallel veins and 150 shafts thereon, in this, the Forest Home District.

A mile south of the Cosumnes' shafts, the title of Mineral City is claimed by about a score of buildings, mostly unoccupied. The little settlement of Forest Home shows at its very threshold its succeeding connection with the copper belt, by a shaft 125 feet in depth, belonging to the Exchange company.

Passing by numerous nameless shafts, scattered here and there for a distance of five miles from Forest Home, I reached the Arroyo Seco company's claim, of 1,300 feet, situated about midway up the western slope of a high ridge. The location was made about a year ago, and until lately was known as the McNealy ground. The claim being within the Spanish grant, which covers several miles of the surrounding country, the original owners were compelled to share their luck with the great claimants. The company has erected a good whim and pump house over a shaft now 200 feet deep. Ore was first struck near the surface in an adjoining shaft which was carried down seventy feet. The vein having disappeared in the main shaft the workmen are drifting north and west through talc and quartz in search of the vein. The west wall is talcose slate, the east apparently trap, though I saw no croppings of the latter exposed. About 300 tons of ore have been shipped from this mine.

Within a stone throw of the Arroyo Seco shaft on the south, is the shaft house of the Johnson Company; shaft 175 feet deep. The workmen are drifting from the bottom for the vein. A dozen tons of ore, the total amount extracted from this mine, are piled up in sacks near the shaft.

Three miles south is the town of Ione, on the outskirts of which the Nigbtingale company have sunk a shaft to the depth of 150 feet, and have in contemplation the project of expending a couple of thousand dollars upon a further depth of 100 feet. Vein a compact white quartz between walls of talc. M.

[To be Continued.]

State Property.—The telegraph has announced that a resolution has passed the Senate at Washington, donating to the State of California the lands embraced in the Mariposa Big Tree grove. Of course the House will "concur" and this great national curiosity will become the property of the State. This is as it should be, and early steps should be taken to secure these monster trees from vandal hands, and preserve them for future generations.

An iron flag has been placed on the Patent Office at Washington. It is handsomely painted in waving folds to imitate the national colors, and is said to present a good appearance. These metal flags are made by the patentee, A. Watson, of Washington City.

[Written for the Mining and Scientific Press.]

Reese River Correspondence.

UNION DISTRICT.

This district is situated in the Smith's creek range of mountains, about sixty miles south of Austin, from which place there is a stage line running twice a week. Persons traveling by private conveyance should turn off the overland road at Westgate. This district is in the new county of Nye, the county seat of which is Ione City, a settlement containing over 300 houses. Ten miles south of Ione, in the same district, is Grantsville, containing 20 houses, and two miles south of Grantsville is Milton, with 15 houses. Wood and water are plenty at Ione. In the Union district there are about 1,100 locations. Those near Ione are encased in granite; those in the vicinity of Grantsville in slate. In extent, the district is ten miles from north to south. The ledge rock near the surface contains gold and silver; but on descending on the ledges the gold becomes invisible, and native silver makes its appearance. The following ledges have had considerable work done on them during the winter, and will average three feet in width: Franklin, Shamrock, Washington, Pleiades, Jo Carrier, Belcher, Clipper, Silver Moon, Albany, Fletcher, Wild Emigrant, Vicksburg, Vanderbilt, California and Keystone. They are located near Ione. Near Grantsville, the ledges upon which considerable labor has been bestowed are: Sapphire, Shoshone, Empire, Mt. Hope, Big Miami, Bullion, Bullion Tunnel Co., Gen. Butler, Lottery, Arctic, West Point, Great Republic, Adriatic, Confidence, Wigwam, Magnolia, Hall & Thornton. These ledges will average five feet in width.

MAMMOTH DISTRICT.

This recently-created district is fifteen miles west of Ione City, on the Edward's creek range. Wood and water are plenty; the ledges two to four feet in width. There are about fifty miners in the district, who have made several hundred locations.

BARNES' PARK DISTRICT.

This district lies north of Union, which it adjoins. About seventy-five locations have been made on ledges similar in character to those near Ione.

SAN ANTONIO DISTRICT

Lies in the southeast portion of the county of Nye, and is about 120 miles south of Austin. Wood and water are almost entirely wanting. This is a most serious drawback to the prosperity of San Antonio, as the ledges are very large and rich. Worked by hand process, it is a common thing for a number of pounds of ore to produce one-third of its gross weight in pure silver. Nye county has a brilliant future before it, but it will probably take two or three years to bring its resources to light, on account of its remoteness from the Great Highway between the east and the west.

AUGUSTA DISTRICT,

Which is contiguous to the west side of Reese River district, contains about sixty locations. The Gen. Scott rock is of a rich character. The Butte Company, on the Oro ledge, shows favorable croppings.

CLAN ALPINE DISTRICT

Contains a number of locations made by Dr. Veatch and party. The Doctor never makes poor locations, so we may expect much from Clan Alpine.

MT. AIRY DISTRICT,

Which, like Clan Alpine, is in the neighborhood of the Augusta district, has produced some favorable indications.

BUNKER HILL DISTRICT.

This district was created out of Saate Fe and Summit districts by a party of men who left Austin, last summer, on a prospecting expedition. In the segregation of a portion of their territory, these districts were not consulted by the Bunker Hill party, whose main object in the creation of a new district must have been the avoidance of paying recorder's fees, as the reputation of Santa Fe and Summit was, and is, equal to that of any section of the whole Reese River region. What is termed the Bunker Hill district, comprises the whole of Pleasant Valley and about five miles on each side of Big Smoky creek, at the mouth of which is the promising town of Kingston. The lower portion of Summit district, or Bunker Hill, contains very rich locations, some of which have been recorded by different parties in different districts. This informality will be the cause of much litigation; but, eventually, the ledges will be held by the first locators, no matter in what district they were recorded. The Brown, Real del Monte, Phœnician, Stephens, Gold Point, Victorine Empire, Morning Star, Jackson & Green, Mountain Boy, are all large ledges. O'Herrin & Co. are about to erect a 20-stamp mill on Big Smoky creek, for the purpose of crushing rock from the Gold Point ledge.

SANTA FE DISTRICT,

In the Santa Fé Valley (Smoky), is the chief attraction in Austin at this time. As work must be resumed on its mammoth ledges by the 1st proximo, miners are harrying thither with *material* for extensive operations. X.

Austin, May, 1864.

[Written for the Mining and Scientific Press.]

Letter from Owensville.

Messrs. Editors:—I have just returned from a trip to San Carlos and Bend City. I found everything in a flourishing condition. The tide of immigration to this valley is setting in in good earnest.—Farmers and cattle and sheep drovers are constantly pouring into the valley. Several thousand head of sheep and cattle have already arrived from Los Angeles and Visalia, and more are on the way.

The working of the mines in Inyo and Russ districts goes on as actively as ever. In the former district several new ledges have been recently opened—Belle Boyde, Boomerang, Columbus and Stonewall Jackson lodes are among the number. They are all turning out well, and will add much to the wealth of the district. Rock taken from the Columbus, at the depth of twenty-five feet, assayed $1300 per ton.—The Superintendent of the Ancho mine showed me some rock from their ledge, taken out at the depth of twenty-two feet, which is also first class rock, being rich in free gold, and showing silver in abundance. The Superintendent of the Santa Rita has arrived and will commence work immediately. The Ida mill which this company have purchased, is a good one and in fine running order.

It only needs an energetic and practical miner for a superintendent to make this enterprise a success. Such they have in the person of Mr. Whiteman, who is a practical miner and assayer. The new mill at San Carlos will soon be completed. At Chrysopolis a company are at work crushing quartz by horse power, with common arrastras.

A party of gentlemen are now at San Carlos, erecting a small furnace, designed for testing the galena and copper ores containing silver, which are so abundantly found in that region. As this work will soon be completed you may look for a good return, and shipment of Owens River Bullion to your city. In Russ District the owners of the New York ledge are developing their mines; they have found the New York to be a first class, well defined ledge, with a quality of rock seldom excelled in any country.

NEW EXPLORATIONS.

Prospectors are exploring the country east of Inyo and Russ districts, with good success. That portion of the country bids fair to become the source of quite as much mineral wealth as any yet discovered. The salt mine lately found there will be of great benefit to the mines on Owens River, as well as to those of Coso. From the White mountains, we hear good reports and are shown rich rock both from old and new discoveries. Mr. Stevens passed through San Carlos on the 5th inst. on his way out to work the White Rover and Dolphia lodes. These ledges are highly spoken of by those that have seen them.

The saw mill at Big Pine is at work and doing good business. Their lumber as well as building and fencing material is eagerly sought by farmers, citizens and miners. Another mill will soon be built on Bishop's Creek to supply the farmers of that creek and Greealys Valleys with fencing. The mines near here are, as a general thing, turning out well. Among the companies at work, the most prominent are the Rubicon, San Francisco, Marathon, Great Western, Vallejo, Pioneer, Leviathan and Silver Creek companies. All of these have large and well defined ledges of gold and silver bearing quartz, from which assays have been made reaching as high as six thousand dollars per ton. I have seen rock from the Rubicon company's mines, which worked over $500 per ton, and rock from the Marathon that will work over $1,000. This is a very large ledge and can be seen distinctly from town—eight miles distant. The Leviathan is highly spoken of and bids fair to become one of our richest mines. The mines north of here and in the same range of mountains are turning out well. Rock containing native silver is found in abundance. The weather in the valley is mild and pleasant. Within the past few days we have had some light showers and the grass along the river bottoms is growing very rapidly and within a month will be suitable for hay. Concora.

Owensville, May 16, 1864.

The Chilian Copper Trade.—We have already announced the falling off of the yield of copper in Chili, and the latest accounts from Valparaiso afford still further confirmation of the fact. They state, that, "notwithstanding the better advices from Europe for some time past, our expectations that a stimulus would be given to the production and export of copper have as yet not been realized, and the probability is, that for a considerable period to come, the exports will be on a reduced scale. There is no doubt but that the mines in Atacama are not yielding much at present, and the ley of the ores is not so rich as formerly. We learn that in the Huasco and Carrizal district, the production of regulus, instead of augmenting, is actually on a reduced scale as compared with 1863. The quantity of bar copper available for export will be increased, and the tendency of the new measure for abolishing the duties on bar copper smelted with Chili combustible, which will soon come into operation, will still further augment the elaboration of that article in this country, reducing very materially those supplies of ores and regulus on which the English smelters have hitherto relied. There is no question but that they will not have nearly enough ores and regulus from this country to supply their wants; and they will be necessitated instead to purchase Chili bar copper much more freely than formerly. We consider that we are only fulfilling our duty in calling attention to these facts, as we apprehend the falling off in exports of ores and regulus is to be very serious. At present most of the ores available are going to the United States." The arrival of the English mail, with advices to Jan. 1, declaring an advance in the price of Chili bars from £92 to £100, caused much excitement, and it was considered that smelters in Europe would yet find it needful to advance prices still further in order to draw supplies. They may take it now as a certain fact that the supplies from Chili during 1864, will be on a small scale, especially those of regulus and ores; and it is generally believed that the shipments of the first nine months of this year will not exceed those of the corresponding period of 1863.—*London Mining Journal, April 2.*

First Monthly Shipment.—The first monthly shipment of Table Mountain copper ore has been received in this city, consisting of 52 tons. It is now lying on Moore & Folger's wharf, and will be dispatched to New York by vessel now loading. This ore is a fine quality of salphurets, assaying 27½ per cent. The lead in the lower level, we are informed, now consists of five feet of sulphurets. At the present time the company are taking out from four to five tons per day. They will put up steam machinery immediately, the same to be paid for out of the products of the ore. The company expect, hereafter, to be able to make regular monthly shipments of ore.

Decorations.—We would call special attention to the advertisment of Mr. Glover, whose taste and skill as a decorator has been endorsed by medals, in at least two instances. His work, as displayed in several of our public rooms exhibits excellent taste in his peculiar art, and stamps him as an artist who ought to receive encouragement from an appreciative public.

Gold in South Australia.—Mr. Hargraves, the original discoverer of gold in Australia, recently started on a gold-prospecting expedition in South Australia. Accounts of a favorable character have been received from him, to the effect that he had already found signs of gold in Bullaparinga.

The most extensive city railroad project yet projected is one now pending before the Pennsylvanin Legislature, which proposes to run cars through fifty different streets in the city of Philadelphia, most of which have not yet a rail in them.

Emigration.—A train of one hundred families left St. Joseph, Mo., on the 17th inst., for Nevada and California. Come along; "the more the merrier."

Summary of Mining News.

CALIFORNIA.

Timely Strike.—A correspondent, writing from Brown's Valley, Yuba county, under date of the 23d inst., states that very rich quartz was struck in the Dannebrage mine—a fortunate circumstanee for all bands, as had this strike not occurred, the men would all have heen discharged in a few days, and the mine closed up on account of its poverty. This busy mining eamp still keeps up its bustle and activity. We are promised regular correspondence from this locality in future.

Another Strike.—A correspondent informs us that Messrs. Autry & Henderson, of Grass Valley, took out on Monday last over $2,000 in specimens from their gravel claim in Mary's Ravine. They took out about the same amount a few weeks since. This is pretty good for old ground that has heen trod over for years and supposed to be worthless.

Rich Quartz.—A very rich vein of gold bearing quartz has recently been found near Howland Flat, Sierra county. The ledge was accidentally struck by a party of men engaged in grading a foundation for a saw mill.

Quartz Ledge.—A valuable and extensive gold bearing quartz ledge has heen discovered near Franklin Hill, in Plumas county, by Messrs, Shaw & Murray. The lode has heen traced and located for a distance of one mile.

Can't Agree.—The Copper City *Pioneer* says the principal offices of the Pittsburg mines should he located at Copper City; the Red Bluff *Independent* thinks Red Bluff is the proper place; the Shasta *Courier* thinks his cotemporaries must be joking and is quite sure that Shasta is just the place for all such offices.

Mining at West Point.—Mining at West Point Calaveras county, is now carried on more extensively, and prosecuted with greater success, this season, than for a number of years past. The idea which has so long prevailed, that our ledges of quartz did not extend to a great depth, has been discarded and a majority of our miners are working leads heretofore abandoned as worthless. Many of them are working 90 and 100 feet below the greatest depth heretofore obtained, and with the most satisfactory results; so says a correspondent of the Calaveras *Chronicle*.

We are pleased to learn that such is the case, and trust that other neighboring districts will soon be able to report in a like encouraging manner. Faith in your mining district and perseveranee in developing your claims, will in the course of time bring you out all right.

Great Mogul Mines.—Work commenced in this District on the 1st of May, and the miners law requires that one day's work shall be performed on every claim of 200 feet, every thirty days, otherwise the claims are liable to he jumped. The Alpine *Chronicle*, published at Markleeville, says that the Elmira company, in this district, commenced a shaft, about four weeks since, and when down thirty-five feet struck the ledge, four and a half feet in width. They had some of the rock tested, and it assayed $18.76 in gold and silver. It is dark blue quartz, containing rich sulphurets of silver and indications of copper, and is increasing in richness as the shaft goes down.

The Morning Star is situated on the east side of the town of Mogul. The company are making the necessary preparations to commence work again. Their tunnel is in 769 feet. They commenced work in October, 1863, and about the time they suspended work, they expected every day, to strike the Mogul ledge, on which their claim is located.

On the Banner, an extension of the Morning Star, they are sinking a shaft which is now 25 feet deep, with the best prospects.

The Superior tunnel is now in 705 feet and being pushed rapidly into the hill, and from indications, they are not far from the ledge.

The above claims are five miles, due east from Markleeville.

No Loss Without Some Gain.—The great flood of 1861-2, which deluged and for the time being, desolated the whole Valley of the Sacramento, appears to have carried at least partial compensation with it. Thousands of acres of new land were formed along the margin of the tule marshes by the sand and rich sediment deposited by the waters, and this season, the fields thus increased in size will he nearly the only ones in the State which will yield plentiful crops.

WASHOE.

Palmyra District.—The claim of the Lyon Company, in the Palmyra District, on a thorough practical working test, yielded $117.76 per ton. The Altamonte Company have their tunnel in 345 feet. Eighty feet more will strike the ledge, at a depth of 240 feet. The Mountain Queen is located in a northerly direction from the Whitman ledge, and has prospected as high as $800 to the ton; it is being rapidly developed—so says the Como *Sentinel*.

The Yolo Company is driving ahead with its work at a rapid rate. They are sinking an incline shaft—now down 100 feet. Some fine rock has been found within a few days. The rock produces mostly gold, very little silver is found. The company will continue down on the incline some two or three hundred feet.

The Clinton & Hubbs is sinking an incline, from a drift run from the shaft sunk some time ago, and from which a lot of rock was crushed. It is expected that the mine will improve in depth.

Kentucky Company—This company keeps steadily at work running its tunnel ahead. This work is now something over 500 feet in length, and is well timbered all the way. It is one of the longest and best tunnels on the American Flat. It is now in such a distance that considerable inconvenience is experienced from the closeness of the air. To remedy this inconvenience a large bellows has been placed at the mouth of the tunnel, from which air is forced in through a tin tube—an inconvenient and expensive way of ventilating, which the company would do well to throw aside, as quickly as possible, and resort to the system of natural ventilation already described in our columns. Quite a large stream of water is now running out of the tunnel, which the company considers very good evidence that they are close upon the ledge.

Utah—The main hoisting shaft of the Utah Company is now down 280 feet, and a drift has just been started in the direction of the lead. The rock is hard, irony granite, and can only he worked by blasting. A considerable amount of water is now coming in, and they are preparing to put in their pump.

Struck it Rich.—We learn through Langton & Co's agent at Como, says the *Enterprise* of the 21st inst., that very rich ore was struck day before yesterday in the Monte del Rey shaft, at the depth of 170 feet. The rock is said to he not only very rich but of a very handsome appearance, none but the best judges being able to distinguish it from the rich black sulphuret ores of the leading mines of the Comstock range.

Lady Bryan, No. 2.—The incline of this Company is down 170 feet and at its bottom a perpendicular shaft is being sunk upon the lead. This is now down twelve feet and some very fine rock is being taken out. Work on the claim is being vigorously prosecuted.

Apple Claim.—This claim, which is a segregated portion of the Belcher, and lies next south of the Midas, is being steadily worked. The shaft on it is now down about 215 feet. Considerable water comes in, although it is not nearly so deep as the shaft on the Midas claim, which is sunk only seventy or eighty feet north from it, and in that there is none at all. This claim is owned by Mr. Robt. Apple, who is doing the work in a very substantial manner.

Independent.—This company has a large quantity of pay rock lying on its dump which has been taken from its mine. It is of the same color and character as that which the Justice company is taking out of its claim. The quartz is of a reddish brown color, and comes out of the mine, mostly in a pulverized state, of about the same consistency as gravel, and contains but few pieces of rock of much size. It is said to yield about $60 to the ton when worked by a good mill.

Lady Bryan.—The Territorial *Enterprise* of the 21st inst., says the Lady Bryan has struck a large deposit of splendid ore—equal to the very best they have ever found. This is supposed to be a continuation of the streak first found, and which, a few months since, caused so much excitement about the mine. Owing to a break, or fault, in the lead, they were for a time off the track of the pay streak and were drifting at random through a large body of quartz containing but small deposits of ore, but they finally worked in the right direction and found it again within twenty feet of where it so mysteriously disappeared.

Good Yield.—The Shasta *Courier* of the 21st inst., says that week the proprietors of the Jollie mill cleaned up after a run of eight days and realized the handsome sum of 51 ounces. Only four hands employed.

New Coal Company.—The Daniel Low Coal Mining Company filed their incorporation on Saturday last. The mine is in Washoe county.

The Fuller Copper Co.—The Marysville *Appeal* says: after six or eight months the Fuller Copper claim, located at Brady's ranch, in this county, at a depth of 157 feet, have struck copper which we should guess to he 40 per cent. pure ore. The claim is still under the superintendence of M. Fuller, Esq., of this city.

Buckeye.—The opening of this claim is progressing finely. The company have lately had about 20 tons of ore worked, and the result, from all accounts, is highly satisfactory. They have twenty tons more out, ready for the mill. They do not anticipate very extraordinary returns from this rock, as what they are now taking out is merely incidental to the proper opening of their claim.

Struck their Ledge.—The Jewett & Shepard cut through into their ledge on Monday last, at a depth of 225 feet, meeting with a large influx of water, which soon drove the workmen from the drift, but not until they had secured about a ton of quartz. The Gold Hill *News*, having seen some of the rock, says that it shows not only considerable free gold, but rich black silver sulphurets also, in sufficient abundance to give it a decided value.

Pride of America.—A drift run from the shaft, at a depth of 150 feet from the surface, developed a very fine ledge, but not of sufficient value in itself to warrant the company in prospecting it at that point. The work of sinking was therefore resumed, and the shaft is now over 200 feet deep. A drift will soon be commenced—probably the present week—and the vein, which will doubtless show good ore, cut a few feet from the shaft.

Coppers Company.—This company is now running a drift at the water level from its shaft along the ledge. The shaft was sunk in a hollow in the hill, and struck the ledge in a poor place, but by following it along a short distance from the shaft, the ledge comes under a ridge, where it rises up and becomes larger and of better quality. The *News* thinks there will be no pay rock taken out at this level. The company will have to go deeper, and erect hoisting works, or wait until some of the companies take the water from this claim by draining their own mines.

Improvement in Working.—Mr. Kuh, an assayer, at Virginia City, informs the Virginia *Union* that the Washoe mills have made a vast improvement recently in the fineness of their bars. Two or three years ago a mill whose bars contained but 300 parts of base metal out of 1,000, thought they were working very close—now the fineness of the bars ranges all the way from 850 to 992. The Government standard is only 900, the remaining 100 being alloy, so that many of the silver bars now being shipped from the Territory are actually purer than our own coin.

The Largest Shaft.—The Ophir Company has for several weeks been sinking a shaft which when it was commenced was the largest in the Territory: but the Savage Company has lately commenced one which is larger still, being upwards of eight feet wide and twenty feet long. The timbers which are used are hewed twelve inches square, and are placed one above the other three feet apart. These timbers divide the shaft into four compartments, each five by six feet in size in the clear. This shaft is now about fifty feet deep.

First Train Overland.—The first train overland arrived at Woodford's Carson Valley, on Thursday last, bound for the other side of the mountains, and will go over the Amador Wagon Road. There are three families in the train, which consists of thirty-two wagons and 300 mules, under the charge of Mr. Glenn. They left the Missouri river on the 15th of March, and were but 60 days in reaching Carson Valley.

Reese River.—The work of development on the mines at Reese River appears to he steadily going forward, and with the most flattering results. Thus far, almost without exception, the mines of that region have improved with depth, both in their yield and in the size of the veins. As a general thing the expensive process of tunneling is dispensed with and the veins are opened by sinking inclines down upon the leads. The deepest incline, thus far, we believe is on the North Star, which, at last accounts was down 200 feet, or 150 feet perpendicular. The vein was found continuous and productive the entire distance.

The Isabella is now down to the depth of between eighty and ninety feet. The ledge which was one of the "razor backs" at the beginning, is now, according to the *Reveille*, about four feet thick. The ore shows abundantly of ruby, native sulphuret and iodide of silver—the latter in great profusion for so rare a variety.

Mining Gossip.

EDITED BY.....FRANK WARDDELL.
FOR THE MINING AND SCIENTIFIC PRESS.

The Way They Do It.

To give our readers a slight idea as to how our Eastern stock-sharpers work the rise in gold to suit themselves, we make the following extract from the Philadelphia *Evening Telegraph*, which illustrates a case in point. It plainly shows that the recent unprecedented advance in gold has little or nothing, comparatively speaking, to do with the condition and prospects of the war. The Eastern papers assert that there is now a bill before the Senate, and which will undoubtedly become a law, imposing pains and penalties on those who, in the interest of gold, conspire against the happiness and welfare of the people. More real injury is done to the interests of the Union by these speculators than would be the loss, in many instances, of a battle; and measures, however harsh and stringent, that may be enacted against such abuses, will be applauded and sternly maintained by the community. If "combinations" must be put down, let those which do irreparable injury be the first to be struck at. If Congress would take these sharpers in hand, and make their baseless speculations criminal, as those of blacklegs, the people, we are convinced, would honor them for the act:—

"Seven brokers on Third street, at the suggestion of a leading spirit, bought large quantities of gold at the lowest point, early Thursday morning. About 10 o'clock, in accordance with the scheme agreed on, they simultaneously telegraphed to their ten correspondents to purchase fifty thousand dollars in gold, *without limit as to price, but limiting the time to ten minutes after receipt of instructions.* The effect was instantaneous. Ten brokers in the New York market, each one eager to earn his commission, without limit to price, all *bidding against each other*, of course gold went up with a bound. At this point the ten conspirators unloaded their gold at a handsome profit, and instantly sold gold short, or, in other words, agreed to deliver to purchasers at a less figure than the maximum, knowing as they did that gold would fall when relieved of the pressure they had put upon it. It did fall, and they again bagged a handsome return at the expense of their fellow-gamblers, who are, of course, savage at the way they have been 'wrung out.' We have it from the best authority that their profits averaged one hundred thousand dollars apiece."

Rush for New York.—Six different parties within our knowledge, took their departure for New York per last steamer, heavily laden with various grades of mining stocks to suit the tastes of Eastern purchasers. There is nothing like giving our friends at home a good assortment to select from, seeing they are determined to invest and become "wealthy in a day."

Board of Brokers.—The directors of a joint stock company of brokers in London, at their recent annual meeting, had a regular fight. Sticks were used, heads were broken, and the police called in.

We have heretofore labored under the impression that our brother brokers in Merry Old England were of the most orderly character; but now we see that they also have their occasional "knock-downs." It is foolish business, this "breaking of heads" over stock transactions.

Dissolution of a Mining Corporation.—The Tajo Gold and Silver Mining Company has filed its application in the County Court for a decree of dissolution. This company was organized about a year ago for the purpose of mining at or near the City of Rosario, in Sinaloa; but it being found inconvenient and undesirable to continue to transact the business under its present corporate form, owing to the peculiarities of the Mexican mining laws, under which the above mine was owned and worked, the above petition for dissolution has been filed.

Blanks for Secretaries.—Blanks, suitable for filling out for advertising, furnished gratuitously to advertisers in the Press, upon application to the office.

Machinery.—Three teams laden with 40,000 pounds of machinery for a quartz claim on Cedar Ranch, near Sonora, left Stockton on the 23d inst.

Ready For Action.—The old Ogden & Wilson mill in Six Mile Cañon, has been overhauled and is now ready for service again.

In Operation.—The new steam mill, recently built by the Mina Rica Mining company, situated near Camp Flores, is now in full operation, and works finely.

Enlarging.—The proprietors of the Pioneer Woolen Mills, at Black Point, intend to enlarge their factory at an early day. This is a good sign as to the increase of business.

On Exhibition.—Several bags of excellent looking rock, said to have been taken from the Golden Rule claim, located in Tuolumne county, have been exhibited within the past few days on Merchant street, near Montgomery.

Reducing.—The Mount Ellen Mining Company have filed in the County Clerk's office, a certificate for the reduction of their capital stock from $600,000 to $360,000, thus making the par value of shares $200 instead of 500 each.

Truly Liberal.—The workmen employed by the Gould & Curry Mining Company, Virginia City, are having a silver brick made, which, when completed, will be worth $5,000, and will be presented to the Sanitary Fund. This is true liberality, surely.

Good Return.—The Blue Gravel claim (placer) at Smartsville, cleaned up, after a run of two weeks of their mill, the snug sum of $44,000. This company, we believe, has recently erected a mill for the crushing of their cemented gravel.

Another Iron Foundry.—Another new and extensive iron foundry is to be erected in this city, by the Vulcan Iron Works Company, which has been duly incorporated, with a capital stock of $250,000, in $100 shares. Messrs. P. Torquet, Richard Ivers C. R. Steiger and Samuel Aitken, are the Trustees.

Another Dissolution.—Judge Cowles, of the County Court, has granted in chambers an order dissolving the Kentucky Copper Mining Co., which desires to re-incorporate under another name. The mine of this Company is located at Copperopolis, Calaveras county.

Insurance Suit.—The Merchants' Mutual Marine company have instituted a suit in the Fourth District Court against one Charles Hare, for the sum of $763.75, due on a policy of insurance issued to the plaintiff by defendant upon a cargo shipped by the latter to New York, per ship "Lizzie Moses."

Owens River Country.—The intelligence that is constantly being received in this city from the Owens River country, is very flattering. The miners seem delighted with their present success and future prospects. The climate, they say, is magnificent.

Black Lists.—We hear that the various "black lists" in the different boards are gradually becoming filled with the names of their unfortunate members who cannot make their "contracts good." Rather severe on you, gents; but "what can't be cured must be endured."

Fatal Accident.—Mr. W. O. Thompson was killed at his claims, located at Chili Gulch, Calaveras county, while working in the shaft, by a large piece of rock falling on him. He was near 35 years of age, and a native of Pennsylvania.

In Town.—Mr. Cummings Cherry, who is considered by the mining community to be one of the most thorough and practical Superintendents in our State, at present Superintendent of the Seneca Mining Co., Virginia, paid us a short visit, a few days ago. We were pleased to see friend Cherry looking so hearty and well, and wish for him a pleasant time during his sojourn among us.

On the Shoulder.—On the afternoon of the 26th inst., quite a lively and scientific display in the "manly art of self defence," came off on Front street, between two individuals doing business in that vicinity. The cause of this highly spirited contest, we learn, was respecting some mining operations. It appears that the parties were unable to settle their argument by mere words, (as they were not *striking* and *forcible* enough) so they concluded to "wind up" the controversy by a social knock down. They went about it in good earnest, and after a few "tussels"—"pugilistic grips," etc., they both "beat to grass." Upon "time" being called, both seemed perfectly satisfied of the fact that they each had enough and that they were making consumats fools of themselves, and furthermore as one was the possessor of a romantic eye, shrouded in mourning, and the other of an enlarged nasal organ, they made all possible haste for their respective places of business—we hope wiser if not better men.

Election of Officers.—At a meeting held at Virginia City by the Santa Fé Mining Company, on the 20th of May, the following gentlemen were duly elected for the ensuing year: Trustees—H. N. Conger, F. A. Marston, J. P. M. Perham, F. W. Earl, and A. G. Rhoads. The Trustees then elected H. N. Conger President; F. A. Marston, Secretary; J. P. M. Perham, Treasurer; and F. W. Earl, Superintendent.

Is it not so?—There are thousands of almost penniless and disappointed men, picking up a precarious living at the extremity of life because they have, in the course of their existence, tried over a hundred different things, and abandoned all in turn, because success was not instantaneous. To a few men only is it given to do more than one or two things well. There is scarcely any pursuit that if followed out with singleness of purpose, will not yield a rich return.

A New Stock Board.—We see it stated by a number of papers that a new stock board, under the control of Geo. W. Dent, Daniel Norcross, A. H. Murdock, Charles A. Crane and E. L. Smith, purpose purchasing from Mr. Thomas Wallace his right, title and interest in his "Open Stock Board." We stated, some time ago, upon what we considered good authority, that Mr. Wallace had disposed of the interest in question; but, from the above remarks, we suppose the sale has not as yet been consummated.

Boston on Stocks.—Recent advices received from Boston remark that the people are having lively and exciting times over mining stocks. They have at last, so it appears, caught the disease which has, for some time past, been prevailing in New York City, known as "feet on the brain." There are now *only* two hundred companies on the market having offices in that city, and the prospects are, and especially if greenbacks are "thrown around so carelessly," that the companies will amount to thousands, instead of hundreds.

East Lynne G. and S. M. Co.—We have inspected, during the past few days, a large lot of splendid paying rock taken from this well known and popular lead, located in Inyo District, Tulare county, Owens River. We notice, upon examination, that the rock is of quite a soft nature, which will render it much easier for working purposes. The news received from the mine is of the most encouraging character. The majority of the stock, we learn, is held by a few private hands, composed mostly of the original locators of the claim, consequently very little of it is changing hands. We, however, quote one sale within our knowledge, during the week, of fifty shares at $27, buyer thirty days. The locators are enterprising and deserving young men, and we wish them every possible success in their enterprise.

Daily Morning Message is the title of a new paper just commenced at Gold Hill, N. T. It is published by George W. Bloor & Co.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

Keokuk Gold, Silver and Copper Mining Company, Clayton Mining District, Contra Costa County, California.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 26th day of May, 1864, an Assessment of Ten (10) cents per Share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, No. 322 Front street or to J. W. Cassiday, at the mine.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 13th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

22-4t Office, 322, Front street, San Francisco.

Legal Tender Notes.

San Francisco, Friday, May 27 ..... 67½ per cent.

Reese River Stock Board—No transactions, of any importance have taken place in the Reese River Stock Board, since our last quotations. The prices offered have not been sufficient to bring out any sellers, except in a single transaction of five feet in Smith & Martin, which sold at $5 per foot. The depression in the Stock market appears to be universal on the Pacific Coast.

The Greenback Question in the Stock Boards. The Virginia Stock Boards, as elsewhere intimated, have sought to remove the present stringency in the money market, in Nevada Territory, by the introduction of greenbacks as currency, instead of coin. They have issued an address and series of resolutions, detailing a plan of action. They propose to start by putting all transactions of the stock market on a legal tender basis, and suggest that a convention be held on the 12th of June, at Virginia City, to agree upon a day after which greenbacks shall be adopted as the currency of the Territory.

A correspondent was appointed some days since to confer with the several stock boards of this city upon the subject. The "San Francisco Stock and Exchange Board," promptly appointed a committee to consider the proposition, which committee made a report yesterday adverse to the propositiou, which report was adopted by the Board, with instructions to the Committee to communicate the action to the Virginia Boards.

The Pacific Board of Brokers have also appointed a committee to consider the subject, which has not, up to the present writing, reported. It is thought, however, that the same action will be taken as in the First Board. Whether the adverse action of the San Francisco Boards will have any effect to modify the course of the Virginia Boards remains to be seen.

Blue Jacket Gold and Silver Mining Company, Devils Gate District, Lyon County, Nevada Territory.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 26th day of May, 1864, an Assessment of 25 cents per Share was levied upon the Capital Stock of said Company, payable on the 30th day of May, 1864, in United States Gold Coin, to the Secretary.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 25 day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 9th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

WM. A. BURT, Secretary.

22-4t Office, 212 California street, San Francisco.

Siskiyou Lion Mining Company, Siskiyou County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 26th day of May, 1864, an Assessment of Fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, in U. S. Gold Coin.

Any stock upon which assessment shall remain unpaid on Saturday, June 25th, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, July 12th, 1864, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAS. C. NORRIS, Secretary.

Office, No. 430 Jackson street.

San Francisco, May 27th, 1864. 22-4t

One copy, six months, in advance,..... 3 00

For sale by Carriers and Newsdealers.

San Francisco:

Saturday Morning, May 28, 1864.

ENLARGEMENT.—We issue, to-day, *Twenty-four Pages*, an increase of *Twenty-four Columns* above the size to which the MINING AND SCIENTIFC PRESS was enlarged on the 1st of January last. We are determined that the generous patronage extended us by those persons who appreciate our liberal rates, and the superiority of this journal as a medium for MINING ADVERTISEMENTS, shall not decrease the amount of space given to reading matter; but as our means increase, we shall spare nothing till every department of the paper is rendered as perfect as possible. At the close of the present volume, on the 1st of July next, we anticipate changing the form of the PRESS, and arranging our advertisements alphabetically.

MINING SHARE MARKET.

The Mining Share Market still continues very much depressed, and speculative shares are generally offered at a decline, although now and then one is found which exhibits some improvement in its figures. New developments at the mines are awaited with much anxiety, as the only thing which can restore confidence. The business of the week foots up at $890,685, a slight improvement over last week.

Ophir shares opened at $1,200 on Saturday, advanced to 1,215 on Monday, but dropped to 1,100 on Thursday.

Gould & Curry opened on Monday at $3,900, advanced to 3,970 on Tuesday, touched 4,000 on Thursday, but dropped again to 3,900 yesterday, with limited business.

Savage had a small business at from $1,900 to 1910; nine feet have changed hands.

Yellow Jacket has dropped to $750; but a single transaction is noticed.

Potosi has not been heard from.

North Potosi has met with quite a large business, but at somewhat reduced prices, ranging from $73 to 87 and closing at 81½; 700 shares have changed hands.

Challar has been more quiet; sales of 212 shares have been made at from $585 to 650, closing at 625.

Burning Moscow fully maintains its activity of last week, and at materially improved rates. We note sales of 610 shares at from $57½ to 77, against $53 to 60, buyer 30 days, last week. It closed at $69, with a weak market.

Seneca has been firmly held, from $27 @ 30, a material improvement over last week.

Uncle Sam still remains quiet at about last week's figures, from $710 to 725, closing at the former figure.

Lady Bryan has again become an important feature in the market, 3,349 shares having changed during the week at from $25@48. Having touched $45 on Saturday of last week this stock gradually dropped to $25 on Thursday, and rallied a little on Friday, and closed at 28.

North American after having dropped, last week, from $150 to 105, opened on Tuesday last at $125 from which figure it gradually advanced to 163 at yesterday's board.

Buckeye has gradually declined, during the week from $12 to 8¾.

Adriatic reached $15 on Monday but declined to 12¼ on Friday, an improvement over previous quotations.

Blue Ledge maintains its previous quotations, from $18@20; Baltic has improved somewhat, and is firm at $80@85; Belcher has been heard from at $820, a material advance over previous quotations.

Burnside is quoted at $6½; Crockett at 8½; Caledonia Tunnel at 15; Crown Point Ravins at 5; El Dorado at 18; Gen. Grant, 35; Green, (G H.) 7; Kohler Brothers, 13; Michigan 35; Meloues 26; Melones Sink, 12; Nevada, J. G., 67@70.

Golden Ags & Enterprise has not improved as was reasonably expected it would; but has fallen off somewhat from its closing figures of last week, and may now be quoted at $32.

Imperial has been heard from at $175; Real del Monte has met with a light business at from $47@52; Sierra Nevada may be quoted at from 57@58; Sacramento & Meredith at 60; Yellow Jacket at 750.

Wids West has gradually dropped during the week from $25@16; Silver Hill is quoted at 5½; Esmeralda at 3½; De Soto, Reese River, at 20.

WASHOE STOCK MARKET.

Review of the Week Ending May 23d, 1864.

The Virginia *Union* speaks in most discouraging terms of the present condition of the Virginia Stock Market. The chief cause to which this prostration is attributed is the scarcity of money, a remedy for which is seen by our Washoe neighbor, only in the adoption of the Federal currency as the basis of business transactions in the Territory. Speaking of this, the *Union* says:—

"The scarcity of money in the country forbids speculation, and the same cause compelling the suspension of labor upon great numbers of mines, depresses the value of such stocks to a figure that keeps holders out of the market. The constant drain upon the coin of the coast, is not compensated by the substitution of paper currency, there being a general distaste for such a change in the circulating medium. The movement on foot among business men to bring about the change, and make Legal Tender Notes the basis of business transactions, will undoubtedly relieve the stringency of the money market to a considerable extent; and in that event a better state of things may dawn upon the mining interests of the Territory, and a greater activity prevail in the stock market."

The transactions, since our last report, have indeed been very trivial. The prices paid are held to be no criterion of the actual value of the mines. We give below the reported sales, so far as they have reached us:—

Pretty much the entire business of the week has been confined to transactions in Jewett & Shepard, of which 550 shares have been sold at prices fluctuating from $26½ @ to $34½ cash, and 40½, buyer 30 days. The business of the week opened at $34 and closed at 26½.

Lady Bryan, No. 2. has met with some little business, 142 shares having changed hands at from $1¾ @ 2¼

De Witt Clinton, 292 shares sold at from $2½ @ 5½, closing at $5.

William Penn, 40 shares, from $11½ @ 13.

Knickerboeker, 50 shares from $32 @ 35.

Seneca, 50 shares from $17½ @ 17¾. Twenty dollars was bid on Wednesday of last week, without finding a buyer.

Harold & Argo, 51 shares sold from $1½ @ 2.

Other sales have taken place as follows:—Branch Mint, 20 shares from $33 @ 34; Colorado, 45 shares from $2¼ to 4; Silver Vale, 15 shares from $1¾ @ 2; Santa Fe, 4 shares 7 @ 9; Pony Express 19 shrs from $3½ @ 4; Kentucky, 10 shares from $4¼ @ 4½; Eureka, 10 at $30; Gray & Cook, 3 at 72½; Dilligent, 5 at $2; San Francisco 40 at $6; Golden Swan, 10 at $1½; Eureka, (G. H.) 12 at $15; Yuba, 10 at $1¾; Champion, 11 at 50 cts; Napoleon, 2 at $6¾; Palo Alto, 10 at $4; Gentry, 37 at $1¼ @ 1½; Leopold, 50 at $6; New Oregon, 15 at $17½; Northern Light, 15 at $1½.

SCIENCE AND MORALITY.

The characteristic distinction between man as a savage, and man as an enlightened human being, has been very properly set down as the difference in the extent of industrial operations, and the progress made in scientific investigation by those classes. The spirit of the age has, in fact, been moulded to its present form by the investigations of science. Turn where we may, into whatever pursuit or condition of life, everything proclaims the importance of scientific research. The slow and antiquated notions of a hundred years ago, would be intolerable to the citizen of to-day. What modern lady could forego her brilliant gas jet for the tallow candle in universal use half a century since. What business man could now think of submitting to the slow and lumbering stage-coach, or the uncertain sailing packet, in which our fathers traveled. With what a semi-rebellious spirit do we of California look upon a break in the telegraph lines which places New York and Washington news forty-eight hours behind date.

Scientific researches and experiments have given us gas, the railroad, the steam engine, the telegraphic wire and a thousand other now almost indispensable comforts and conveniences, of which our fathers never dreamed. And still the more we achieve, the more we desire. The spirit of the age calls for constant and unremitting industry in scientific research. So imbued with this spirit have all civilized nations become, that industrial schools, of all grades, and for all classes, are almost every where coming into notice. The idea, once so prevalent, that industrial education was a mere visionary idea of impracticable men is now quite effectively done away with, and there is, at the present time, scarcely any limit to the amount of money and time devoted to scientific investigations, in all the experimented sciences.

In contemplating the progressive intellectuality of the age, we should not forget that it is indispensable to *continued* national progress, that our statesmen, scholars and scientific men, whether of mechanical or professional position, should recognize the principle that all human prosperity is founded, primarily, upon christian morality. Civilization can never make any noticeable advance without that important basis. Experiments to the contrary have been tried time and time again, but never with any marked degree of success. Jewish history everywhere attests that a nation's prosperity is meeted out in accordance with its morality. One of Rome's greatest historians attributes the decay of that renowned empire to the fact that her citizens forgot the presence of the gods. Greece and Egypt tried it and failed. China has for untold ages been striving for a place among civilized nations, but her idolatrous superstitions bind her down to ignorance and never ending decay. France assayed to negative the proposition by deifying reason; the terrible days of her subsequent trials and sufferings tell us with what success. Even now, with her *quasi* recognition of Divine guidance and her voluptuous capital, acknowledged as the metropolis of civilization, art and fashion, she sleeps upon a volcano which may break out at any hour and again bathe that nation in an ocean of blood and carnage.

Who will say that the terrible ordeal through which our own people are now passing, may not be attributed to national sins, from which nothing but a baptism of blood can wash us clean. Christianity, independent of creeds, aided and sustained by intelligence and industry, is the world's only hope of happiness and permanent prosperity.

ELECTION.—The annual meeting of the stockholders of the San Francisco City Water Works was held on the 25th, and the following gentlemen elected trustees: J. B. Thomas, John Parrot, H. S. Dexter, John Bensley, Erwin Davis, C. L. Low and R. G. Sneath. This is the same Board of Trustees which has served during the past year.

The Daily Press on the Mines and Mining.

It has become a chronic disease with the daily press of this city to break out into regular spasms of complaint and warning against *feet* and *mining stocks*. Such expressions as "insane traffic," "wildcat mines," "crazed speculators," etc., etc., are kept constantly on hand, and at short intervals fulminated in leaders made up of silly platitudes and meaningless diatribes against the leading interest of our State and the adjoining Territories. It is utter folly to attempt to deny that the greatest, most important, and, in the full sense of the word, *leading* interests of this coast are mines and mining. Yet, in the face of this fact, in spite of the monthly, weekly, aye, daily out-pourings of bullion and treasure into the lap of San Francisco, within sight of the magnificent buildings already added to our thoroughfares, and within hearing of the golden chime of the metallic currency, flowing through our marts of trade—all the result of the fostering spirit of mining development shown by this community, during the past few years, we find in a city contemporary, the *Morning Call*, the following language, under the heading, "The Mining Mania," which we select, not as an isolated case, but as an index of the general tone of the daily press of this city upon our leading industrial pursuit:—

The thirst for sudden acquisition of wealth is not a new disease, nor is it confined to San Francisco, although it is raging here, and has been at intervals for fifteen years. Within the past few months it has been as virulent as the small pox, and its development in the insane traffic in all sorts of mining stocks, is, to those not inoculated, quite as disgusting as that loathsome disease. Montgomery street has been worse than the wards of a cholera hospital, worse than the hall of an insane asylum when the doors of all the cells have been opened and the whole crowd of furious maniacs let out. God save us forever from the madness that has raged on our great thoroughfare, and from the society of those affected with "feet on the brain." Even one of our strong weak-minded spiritists is less intolerable than these poor, demented creatures. * * * Where is all this mania to end? No means have been spared to inoculate the innocents. Brokers' Boards have aided, the press has been stifled with the truths—few, we fear—and lies, many, we know—which have been written to blow the bubble to its utmost capacity. Specimens from rich mines, the Comstock lead particularly, have been exhibited and assayed, and the results published as the production from hundreds of other real or pretended ledges, and the human gudgeons have snapped at the bait with more than the usual voracity of that greedy creature. The Telegraph has been a convenient and potent power in this inflation, and bogus dispatches have been as plenty as bogus specimens from bogus miners. The finale has already come to more than one, suicide settling all claims and engagements for stocks. Such poor fellows, having paid the last dollar in assessments, squared accounts by paying the last levy made by death.

It is against such indiscriminate blending of good and bad, in one common condemnation, that we protest. As well might it be said that because some firms dealing in provisions, dry goods or hardware, through unbusiness-like negligence or culpable carelessness, fail and become bankrupt, that all others should shun those branches of trade as they would the pestilence, as to argue that because some rash, unthinking individuals, who would probably wind up with a crash in any business, from soap boiling to stock broking, in which they might engage, have rushed, pell mell, into stock speculating, and as a matter of course been food for every sharper who saw them; or that this shall be considered sufficient cause for denouncing all, who, with cool heads and sensible calculations of the chances, are engaged in mining, either in the stock market or in the mine itself, as "a crowd of furious maniacs."

We wage bitter war against wild-cat mining and treacherous duplicity. These have not, nor will they, receive, an atom of mercy at our hands; but at the same time, aspiring as we do to be (and believing that we are so considered), the leading mining journal of this coast, we intend to take by the hand, and with all our might endeavor to help and encourage every legitimate mining enterprise within our knowledge, knowing as we well do that the liberal development of our mines is the true road to a future for California and Nevada, that will, by its brilliancy, cast into the shade their already triumphant past.

ESMERALDA.

The Esmeralda papers speak very encouragingly, at the present time, of the mines of that section. They affirm that abuses have pretty generally passed away, and that the miners have set to work in earnest to develop instead of to sell their claims. Those who continue persistently in such a course, will be almost sure of a rich reward. The mills are pushed to their utmost capacity day and night, and are turning out bullion, at a rapid rate, from the numerous claims now being worked. The owners of small claims are oftentimes forced to wait a long time for their turn at the mill.

The Young America recently turned out $5,179 from 39½ tons of rock ($131 per ton), at the Bodie mill. This crushing cleared the company of debt, and left $1 per share in the treasury. The ore since taken out is considered even richer still. The rock requires no selection; the entire amount raised being taken direct to the mill. The stock of this company is now reported as worth $30 per foot in Aurora. The Aurora *Times* thinks it would be quoted at $1,000 if it was located in Virginia City. This stock would doubtless advance to a much higher figure were it not for fear of litigation with the Antelope Company. The *Times* of the 19th instant, however, learns that the parties interested have come to a very sensible conclusion, as follows, which will probably save the expense of litigation, and at the same time admit of the mine being worked: The Antelope agrees that the Young America may crush enough of the ore to pay the laborers—no more, while the Antelope promises to push their drift as rapidly as they can towards the Young America, so as to prove whether or no it is the same ledge. If it turns out to be, the Young America is to give it up; if not, the Antelope is to relinquish all claim.

The Golden Age and Empire is still taking out very rich rock. But little waste comes from the mine; nearly the entire mass raised being pay rock. The last crushing of 200 tons of ore realized $180 per ton! The reception of the bullion in this city, $35,552, we announced in our last issue. The previous crushing was at the rate of $105 to the ton. It would seem from these results that this should be classed among our best mines. The *Times* says the stock is now held at $350 per foot. It was sold in this city, however, on Monday last, for $37½. This mine is under the superintendence of Capt. George Benson. A dividend of $5 per share was paid by this company on Thursday last.

The Iowa is turning out excellent rock, showing both gold and silver to the naked eye.

The Pennsylvania Tunnel is one of the most important enterprises in Aurora. At 300 feet they struck a promising ledge, upon which active operations are about to be commenced. This tunnel is now in 750 feet, and will soon strike the Crockett ledge. About 500 feet further will take them to the Real del Monte—making 1,300 feet in all.

The Real del Monte, just now, has a monopoly of all the best mills in its vicinity, and less important companies are obliged to stand aloof, and take whatever they can get. It is said that the present yield of the rock from this mine is from $60@130 per ton. The repairs upon the company's mill were to have been completed, and the mill put in operation again, this week.

The Durand Mill is spoken of as being one of the most perfect in the Territory. It has recently been engaged in crushing rock for the Golden Age and Empire.

The Enterprise Ledge is improving in size and richness. It is now seven feet wide, and shows much free gold.

Wide West.—The incline shaft upon this mine has reached a depth of 160 feet. A few weeks since the lead in this incline had dwindled down to an inch and a half in width. It has since increased to four and a-half feet, with the rock looking well. Water is just beginning to make its appearance in the shaft. A small crushing from this rock, for a test of its value, was to have been made this week.

The Antelope continues regularly at work, and is quite as regular in its pay. The company is out of debt, with an excellent mine, systematically worked, and under the charge of a Superintendent who thoroughly understands his business.

The Utah, which has passed through many changes of good and ill fortune, appears to be rapidly being brought into a condition of permanent prosperity, under the judicious and energetic management of its present Superintendent, Mr. Bann. He is now down 200 feet, and taking out rock of the most unmistakable excellence. A contract has been made for crushing 50 tons at the Independence mill, and he expects soon to be able to keep a mill running constantly. The rock is expected to pay from $65@$100 to the ton.

Bullion to the amount of $60,290 was shipped from Aurora on the 18th instant, as follows: Antelope, $6,275; Real del Monte, $15,500; Golden Age and Empire, $35,552; miscellaneous, $2,963.

The operations of the past few weeks have done much to restore confidence in the wealth and permanency of the Esmeralda mines. Companies and individuals have very properly dismissed their anxiety for a rise in stocks, and are devoting their entire energies to the development of their claims. The policy of such a course is already apparent.

Who the Speculators are.—The New York *Journal of Commerce* gives the following, which contains "more truth than poetry:—"

We notice newspapers are denouncing the "Wall street operators," and rejoicing over the "lame ducks" among that much abused fraternity. Have the writers of these fancy squibs any idea who the stock gamblers are? It is not the "Wall street broker," nor the "William street shark," nor any other mere instrument, who have been carrying on this exciting game. It is the minister, the doctor, the lawyer, the merchant, the mechanic, the ship-owner, the banker; and if we have heard aright, the newspaper writer himself, who have been principals in these transactions. The whole community appeared to have been inoculated with an ungovernable appetite, amounting to mania, for this stimulant, and words of warning were of no avail. Let no one think that the evil will be cured by this sudden check. A brief interval, a day or two's sobriety, is all that can be expected, and the bottle will go again to the lip.

Sound Talk.—The following sensible answer we clip from the Aurora *Times*, of May 16th. It comes so near to our own ideas on the subject, that we take pleasure in offering it for the perusal of our readers:—

"We were asked, the other day, 'Why is it while Aurora mines are really turning out more gold now than at any time before, her stocks are worth so little in the market?' The mining fever has subsided; all mining stocks are on a downward tendency. Snap judgment has been taken of some of them; thieving tricks played on others; the danger of having the tax levied upon the mines—all these taken together would probably indicate the answer. Aurora will survive the present shock; and after it shall have passed away, will commence a better and healthier life, that will lead on to fortune."

Miniature Engine.—We have seen a curiosity in the jewelry store of E. M. Wright, on D street, in the shape of a miniature steam engine, of about one quarter horse power, in full operation. The engine is of brass, silver plated. The bed is one foot long, cylinder, one and three-quarter inches in diameter, and two inch stroke. The balance wheel is seven and a half inches in diameter. Attached is a copper boiler eighteen inches long by six in diameter. The engine was originally constructed by Mr. Young of Oroville, and the boiler by D. E. Knight of this city. The whole institution has been remodeled by Mr. Wright. It is intended to be made use of in running a sewing machine. The engine is a fine piece of mechanism, and reflects much credit on its ingenious builders.—*Marysville Express.*

The Cariboo Mines.—The Victoria papers state that nearly all the miners have now left Victoria for Cariboo, from which place a very prosperous yield is expected the coming summer. The population at the mines the present season, although smaller than that of the two previous years, is at least much better prepared for exigencies. Large sums of money have been invested in Cariboo, in the shape of bed rock flume and bed rock drain companies, and an artesian boring company is now in operation at the mines.

The Philadelphia North American says the demand for diamonds has increased until it assumes nearly the dimensions of a mania. Dealers admit that prices are exhorbitant, yet they have large orders to be filled. In many cases they are bought as investments.

Mechanical Department.

[Written for the Mining and Scientific Press.]

HOME INDUSTRY.

VULCAN FOUNDRY AND IRON WORKS.

This establishment is on First street, corner of Natoma, and was commenced originally by Mr. Geo. Gordon, of the Sugar Refinery, and Mr. E. T. Steen. The present firm consists of four gentlemen—Messrs. Steiger, Aitkin and Ivers, with Mr. P. Torquet as manager. They employ 160 hands, and consume on an average, every month, about 176,000 lbs. of iron for castings, 44,000 lbs. boiler iron, 37,000 lbs. wrought iron; other materials, 25,000 lbs.; steam coal, 40 tons a month; forge coal, 45 tons; foundry coal, for melting, 50 tons; lumber, for flasks, patterns and frames of machinery, 10,000 feet a month. Their largest casting weighed seven tons, but their capacity in this respect is equal to any establishment in the State. The splendid beam engine at present in use at the Gould & Curry mine, issued from the Vulcan, and is spoken of as a piece of workmanship creditable to any country. Its dimensions are large—30 inches bore, 6 feet stroke, 300 horse power; in fact the largest of the kind so far built in California. The only new article at present on hand of particular interest to our readers is the Hepburn & Peterson amalgamator, recently illustrated and described in the Press. It is seldom, however, that a visit can be made to the Vulcan without finding in their vast assortment of mining machinery a variety of new and interesting articles connected with that branch of their business. The firm are on the eve of completing one of the largest, if not the largest, boiler ever manufactured in this city. It is intended for the British ship Thames, of Victoria, and in every respect reflects credit on the establishment. It is 14 feet long, shell oval, 8 feet by 9 feet, contains 76 return tubes, each four inches in diameter, weighs 14½ tons; power, 200 horse. Attached to these works are three different establishments, each in itself as complete as modern science and improvement can make it, from which every description of iron work is turned out in the best style. We know no one more worthy his popularity than Mr. P. Torquet, the gentlemanly manager.

It has of late been supposed that the above firm intended building an immense new foundry commensurate with their growing business. Their re-incorporation, however, is not for such a purpose. At present they are extending their premises to the north side of Fremont street, where their general works will be in future. The peculiar feature in this enlargement when completed is, that the boiler will remain in the old works on the south side of that street, and the steam necessary for the entire machinery conveyed in pipes under ground. By this arrangement they will save both expense and space. Nothing will be omitted in any department to make the works equal to the reputation of the firm.

MINERS' FOUNDRY.

This establishment is also on First street, near Folsom, and is of comparative recent date, being commenced in 1856. The proprietors, Messrs. Howland, Angell & King, are practical mechanics, and owe their present position to their own industry, enterprise and skill. Though of recent date, these works are rapidly assuming large proportions. They employ from 150 to 170 hands, and during their heaviest pressure of business have consumed, on an average, the enormous amount of seven tons of iron for casting and one ton of bar iron a day, with a proportionate amount of coal and lumber. They make no boilers; thus their consumption is confined to two kinds of iron. Their heaviest casting weighed seven tons—a punch and shears for Coffey & Risdon; but they calculate they have the capacity to melt 20 tons at once. Their principal work is mining machinery. The capital stock of this firm ranges from $150,000 to $200,000. Up to the close of last winter they manufactured on an average one of Wheeler's amalgamators a day. Farrand's and Mr. Howland's own pan are now having a run. At present they are manufacturing a number of large iron tanks for the Borax Works, Clear Lake, Napa. These tanks are eight feet in circumference and nine feet deep, without a bottom. They are sunk in the mud where the water is shallow, pumped dry, and the mud left in them strained for the borax. By this process they obtain about a ton a day. After being refined in this city it is considered a good article. Mr. Howland has lately invented a new amalgamator, now on exhibition at the works, called the cylinder amalgamator, which is rapidly coming into repute. It differs from all others in its construction, and resembles a large grindstone more than anything else. The pulp is put inside the cylinder, in which three arms revolve, with considerable velocity, creating a heat which vaporizes the mercury sufficiently to salivate if not kept tightly closed. Hence there is no need for the application of steam. How so great a heat is produced by the simple velocity of the arms is as yet an unanswered question. This much, however, is certain: it amalgamates thoroughly. We also saw here a new hydraulic wheel, the chief feature of which is to obtain power by a small body of water with a large fall, instead of a large body of water with a small fall. In many parts of the mountains this wheel will be very useful to quartz miners, for whose especial use it is intended. Attached to these works is a pattern shop, and a remarkably perfect miners' laboratory, for testing rock or amalgamating on any scale. Altogether the Miners' Foundry is a complete establishment, creditable alike to the proprietors and the city.

[To be continued in our next.]

Obtaining Iron from its Ore.—In the ordinary method of obtaining iron from its ore, the stone or ore is calcined, then mixed with coke, coals and limestone, and afterwards submitted to the action of a hot or cold blast-furnace. Mr. Silvester Ingledew, of Stocktou-on-Tees, proposes to obtain the iron from the ore without the aid of a blast-furnace, and consists, first, in reducing the ore by grinding or pulverizing in an ordinary grinding apparatus, or one suitably arranged for the purpose; it is then to be placed in a perforated rotating chamber or receptacle, through which water passes, wherein the heavier particles of granulated metal are precipitated by gravity to the bottom, the lighter earthy and other matters being carried off by the water. This residuum of washed granulated iron ore (which still retains a small quantity of silicate and silicate of potassium) is then conveyed to an open flat vessel or "drying frame," where the moisture is evaporated therefrom, and it is afterwards passed into an ordinary air or reverberatory furnace, by which it is reduced to cast metal. In order to regulate the quality of the iron, he employs, in connection with the granulated iron from the drying frame, any necessary proportion of alkaline earth, alkaline bases, and carbonaceous matter, which will have the effect of chemically combining with any extraneous matter, so as to facilitate the separation of the iron, and so influence the quality of the same as to render it applicable to the production of bar-iron, plates, or other descriptions of manufactured iron.—*London Mining Journal.*

New Motive-Power.—Profs. Barsanti and Mattencci, of Florence, have invented a new mode of motive power. Their engine may be described as an atmospheric engine, a vacuum being produced in the cylinders, under the pistons, by the explosion of a mixture of atmospheric air with an inflammable gas. The explosion is said to be without noise, and free from danger. The result of a long series of experiments upon two machines—one of them being of twenty horse-power and the other of four—proves that the consumption of the gas used is one-third of a cubic metre per horse-power per hour. The gas is said to be produced at a cost of less than a penny the cubic metre; consequently, a horse-power can be obtained at about one-third of a penny the hour. The machines constructed are reported to work satisfactorily, and the principle to be equally applicable to marine and locomotive engines. Several patents have been taken out in this country for machines of this class. Hitherto, however, all explosive engines have failed to fulfil the promises of the inventor.—*Athenæum.*

Hotel Elevators.—It appears from the proceedings of the Institute of British Architects, that the principle of hydraulics is being successfully applied in the place of steam power in many cases. The Brighton Hotel contains a machine which, moved by the weight of water with a sufficient head, raises the visitors and the luggage from the lower story to the upper, which is seventy-seven feet from the ground. The elevator in the Fifth Avenue Hotel is operated by steam. At the Grand Hotel in Paris, the elevators are put in motion by means of Lenoir's gas engine, which, it is said, performs its office with economy and cleanliness, and requires but very little attention.

Washoe Building Steam Engines.—The Fulton Foundry is manufacturing a steam engine, to be used for driving a pump at the Bullion works. The pump, which is of 8-inch bore and 6-foot stroke, is being made at the Fulton Foundry, and is the first engine and pump ever undertaken to be manufactured in the Territory.

American Inventions Claimed by Europeans—Interesting Experiments.—At a late meeting of the Polytechnic Institution of New York, Mr. Maynard stated that the impression which generally obtained both in this country and Europe, that horizontal shell firing was inaugurated by the Russians, was altogether erroneous. During the administration of Mr. Jefferson, Colonel Bomford, of the U. S. Army, devised and had cast a nine-inch gun to throw shells horizontally. He proposed that it should be adopted by the Government; but the proposition was declined, and the matter dropped for a while. In the meantime, Col. Paixan, of the French service, saw the gun, thought well of it, and recommended it to his Government, by whom it was adopted and named, after him, the Paixan gun, of which we heard so much a few years ago. It was subsequently adopted by our Government, and re-christened the "Columbiad." It was with a gun of this construction that Col. Dahlgren made his experiments to determine the pressure in different parts of the gun while the ball was passing out. The result of these experiments led to a change in the distribution of the metal composing the gun, which has now taken the less ornamented but more serviceable form, which is seen in the two big Camanche guns, now in the ship-yard at the foot of Third street, in this city.

Ever since American mechanics commenced constructing guns, they have led all other nations, both in efficiency and weight of metal. The same may be said of small arms. The English, however, are entitled to the palm in artillery projectiles. Their steel round and steel-pointed shot are the most effective projectiles yet employed, and recent experiments in England go to show that at short range, and properly projected, no iron plating has yet been made which can withstand them. At the experiment above alluded to, two iron 300-pound shots were successively discharged from a 600-pounder, loaded with 90 lbs. of powder, at a target eleven inches in thickness. The target was uninjured—not even a bolt was started. A steel shot, weighing 344 lbs., was then placed in the gun, with the same amount of powder. The target was split completely in two, and the two pieces thrown several feet to the right and left, while the ball rebounded against a second target, placed just behind the first, and was found fourteen feet in front, somewhat flattened from the force of the terrible blow it had delivered, but not broken in pieces. No iron plating has yet been put together which could have withstood that blow. The Minnie bullet is a Prussian invention, and takes the palm over any rifle projectile yet presented to the public. The latest improvement in casting guns is that recently so successfully carried out, a few weeks since, in casting the huge 20-inch gun at Pittsburg, and which has already been described in the Press.

Cheap Paints.—The essential part of all good paints, properly so called, is linseed oil. Oil, if well boiled, may be applied alone, and affords an excellent protection to hard wood and implements, and upon floors. Sundry substances ground very fine are used to mix with the oil, and in proportion as they thicken the oil and form an opaque coating, they are said to possess "body." A pretty good cheap paint for outside work is made by mixing plaster of Paris with white lead, or zinc white, and grinding them together in a paint mill with oil. Plaster alone may be used, and is said to form a durable and cheap paint. Of course any color may be given which is desired.—*American Agriculturist.*

Cleanness of Gun-cotton.—In their report to the Austrian Government, the Commission appointed to examine gun cotton say:—"From the steel barrel of a rifle, 40 rounds have been fired with gun-cotton cartridges, which have hit the target 300 yards distant, in an unexceptionable manner. After the said number of rounds, the barrel was internally as clean and polished as a mirror."

The Andes.—The Andes company, whose shaft is 170 feet deep, have commenced drifting toward their ledge. This claim is an extension of the Jewett & Shepard in American Flat.

Patent Department.

A New Tunneling Machine is spoken of in an English paper, manufactured by Messrs. Hawks, Crawshay & Sons, of Gateshead, which is now being used at Spezzia, on the eastern section of the Ligurian line of railway, in cutting one of the tunnels through the Maritime Alps, between that port and Genoa. It is said to cut a hole 7½ feet in diameter, at the rate of 14 feet advance in 24 hours, through very hard rock, consisting chiefly of limestone, with veins of a tougher character running through it. Three men and a boy work the machine by the aid of steam or compressed air.

We presume that few of our readers acquainted with tunneling in hard rock will credit the statement of the amount of work which it is claimed this machine will accomplish. If it will perform one quarter of the work claimed for it, at any ordinary cost of running, the invention would be invaluable in California. It has ever been a wonder to us that no thorough trial has yet been made of any tunneling machine in California. We have already, at least two patent tunneling machines in this city, either of which, would, in the opinion of good mechanics, make a vast saving in both money and time over ordinary handwork; yet neither have yet been fairly tried with continuous work. Why do not some of our enterprising miners give these machines a fair trial? An opportunity to do so can be secured on most advantageous terms.

Slide Valve Improvements.—In the official report of patents granted for the week ending April 5th, we notice two new patents for improvements in the slide valve of steam engines. The first was granted to Mr. John Baird, of New York city, who claims the combination of a face plate with a slide valve, whereby an endwise or latteral motion of the former causes its acting face to recede from or approach the back of the latter.

The second was granted to Isaac V. Holmes, also of New York city, who claims the combination with a slide valve, which is double-ported both for steam and exhaust, of a cut-off valve or valves riding directly on the back thereof; also the construction and arrangements of the several ports of a double-ported valve, whereby the steam, exhausted through two of the exhaust ports, may pass the inner steam ports on its way to the main exhaust port, and all the steam ports are brought into the back of the valve, so that a cut-off valve or valves may be applied to ride directly thereon.

Cheap Gas.—A company in New York has a patent for a new sort of gas, which evolves so much heat that it is designed to use it largely for cooking and similar purposes as well as for illumination.—Stoves—small hand stoves—are already made, in which cooking by gas is done (for summer use) at one cent an hour; but the new gas company proposes to enable you to cook away at half a cent an hour, and to warm your rooms in winter at ten cents per day!—*Exchange.*

Much time and money has been expended in efforts to produce a cheap gas—such as can be used economically for heating purposes—but as yet, we believe, with very little success. It is well to give every invention a fair trial before condemning it; but we must beg leave to entertain serious doubts about the production of a gas cheap enough to warm a room of any considerable size in a New York winter, at a cost of only ten cents per day.

How to Render Ivory Flexible.—Ivory, like the substance of all teeth, consists of about 70 per cent. of phosphate of lime, 10 per cent. of carbonate of lime, and 20 per cent. of gelatinous matter, or cartilage. Immerse it in a strong solution of phosphoric acid until it becomes transparent, then take it out, wash in water, and dry with a soft cloth, and it will be found as flexible as leather. On exposure to the air, it returns to its original hardness; but may be again rendered flexible by merely soaking it in hot water.

Improved Mechanical Puddlers.—Some months since we gave an account of a mechanical apparatus for puddling iron, which had recently been introduced on the continent of Europe, and for which patents had been taken out. Later accounts not only fully confirm the complete success of this mechanical contrivance, to supersede by machinery the most laborious and exhausting labor ever attempted in the whole range of mechanical operations, but speak of still further improvements in the operation. These puddlers have now been in constant use at the Clos-Mortier Forges (located in Germany, if we are not mistaken,) for two years. During that time they have been subjected to numerous and continued experiments, by which they have been successively improved and simplified; until the result of their working at the seven different furnaces to which they have been fitted, is so satisfactory that the patentee has now no hesitation in applying them, without further modifications, to furnaces generally. The April number of the London *Mining and Smelting Magazine* contains a full illustration of this new and important invention. It is difficult to estimate too highly its value and importance, especially in the present state of the labor market, and the rapidly increasing consumption of the world's great staple, iron.

In Philadelphia there are 357 miles of water pipe and 592 miles of gas pipe.

The Mining and Scientific Press Patent Agency.

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent? A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his has been used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons presented for the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last instalment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	25
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No duty. All the papers, models, etc., are sent by the Commissioner to the Judge, who after review of the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appelant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner San some and Washington streets, San Francisco.

Rubicon Gold & Silver Mining Company No. 1. Location of the mine, Keyes District, Owens River, Mono county California.

Notice is hereby given, that in accordance with the laws of the State of California, and an order duly made by the Board of Trustees of the Rubicon, Gold and Silver Mining Company, No. 1, there will be sold at public auction, to the highest bidder, for cash in U. S. gold Coin, on the 17th day of June, 1864, at 11 o'clock, A. M. of that day, at the office of the Company, No. 7 and 8 third floor No. 302 Montgomery street, San Francisco, so many shares of the Capital Stock of the above Company, standing in the names of the following persons or shareholders as will be necessary for the payment of assessment No 5, of ten (10) cents per share duly levied thereon, April 18, 1864, by the Board of Trustees, together with the expenses of advertisment and sale, unless said assessment and charges are previously paid.

San Francisco; May 27, 1864. 22-2t

For Sale—A Useful Invention.—EDITORS PRESS:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a devise of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test, under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-tf

San Lorenzo Gold and Silver Mining Company, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of May, 1864, an assessment of fifty (50) cents per share was levied upon the Capital stock of said Company, payable on the 25th day of May, 1864, in United States Gold Coin, to the Secretary, at the office of the Company, or to DANIEL S. FLAGG, Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on SATURDAY, the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 11th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

MILO CALKIN, Secretary.

Office, No. 537 Washington Street, San Francisco. 22-4t

Mechanics Gold, Silver and Copper Mining Company, Clayton Mining District, Contra Costa County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of May, 1864, an Assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, or to J. W. CASSIDY, Superintendent at the mine.

Any stock upon which said Assessment shall remain unpaid on Saturday the 25th day of June, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on Wednesday, the 13th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEGAR, Sec'y.

22-4t Office, No 322, Front Street, San Francisco.

Blue Dragon Mining Company, Inyo District, Tulare County California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 23d day of May, 1864, an assessment of twenty cents per share was levied upon the Capital Stock of said Company, payable immediately, in Gold Coin of the United States, to the Secretary, at the office of the Company, 728 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the Twenty-Fifth day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

N. G. FRENCH, Secretary.

22-4t Office, 728 Montgomery street, San Francisco.

Brewer Gold and Silver Mining Company, Silver King District, Amador county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of May, 1864, an Assessment of fifteen cents per share was levied upon all the assessable Capital Stock of said Company, payable on the 21st day of June, A. D., 1864, in United States gold coin, to the Secretary, F. A. Brewer, No. 40 Montgomery Block, San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 7th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees. F. A. BREWER, Sec'y

22-4t Office, No. 40, Montgomery Block, San Francisco, Cal.

Potomac Gold and Silver Mining Company, Reese River District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held May 23d, 1864, an assessment of one ($1) dollar per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, or to F. A. MILLER, Superintendent at Austin, N. T.

Any Stock upon which said assessment shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 11th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

GEO. A. BALL, Sec'y.

22-4t Office, 509 Clay Street, San Francisco.

Office of the Ontario and Webster Gold and Silver Mining Companies, Location of Works, Montgomery District Mono County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Companies, held on the 26th day of May, 1864, an assessment of twenty-five cents per share was levied upon the assessable stock of said Companies, payable immediately, in United States gold coin, to the Secretary, at the office of said Companies.

Any stock upon which said Assessment shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. H. B. SHELDON, Secretary.

Office, N. E. corner Montgomery and Pine Sts., Room, No. 2, 3rd floor. Office hours from 12½ M. to 2 P. M. 22-4t

Mountain Mary Gold and Silver Mining Company, Silver Mountain, Alpine county, Cal.

Notice—There are delinquent upon the following described stock, on account of Assessment levied on the 23d day of April, 1864, the several amounts set opposite the names of the respective shareholders, as follows:—

Names.	No. Certificate.	No. Shares.	Amt.
Goodell, C	not issued	250	$62 50
Haine, Samuel	not issued	100	25 00
Osborn, Charles	not issued	50	12 50
Skinner, M. B	not issued	240	60 00
Sykes, J. H	not issued	125	31 25
Sheldon, Mary A	not issued	125	31 25
Wright, J. O	not issued	25	6 25

And in accordance with law, and an order of the Board of Trustees, made on the 23d day of April, 1864, so many shares of said stock as may be necessary, will be sold, at the office of the Company, on the 16th day of June, 1864, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. WARREN CLARK, Secretary.

Office, No. 439 Montgomery street, Room No. 5, 3d floor, San Francisco. 22-4t

Mechanical.

REYNOLD'S

Patent Cut-Off and Governor,

For Steam Engines.

127 of these Invaluable Machines

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 75 per cent of the Fuel.

Steen's Improved Governor

IS THE CHEAPEST, SIMPLEST AND QUICKEST TO ACT AND least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, at the Stone Breaker, foot of Montgomery Street and at the Sugar Refinery, 8th Street, San Francisco.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., Etc., bought and sold the best market rates.

Anti-Incrustation Powder,

A sure remedy for Scale in Steam Boilers, without injury to the Iron. In use for the past EIGHT years.

☞ Machinery Made and Repaired. ☜

—Refer to—

Sugar Refinery, San Francisco,
Cottell & Co., San Jose,
L. A. Booth, Esq., Virginia City,
And 2,000 others in the United States.

E. T. STEEN.

1-tf Nos. 37 & 39 Fremont Street and 42 & 44 Beal Street.

MINERS' FOUNDRY

—AND—

MACHINE WORKS,

First street, between Howard and Folsom streets,
SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the **Best** and **Most Economical**, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

No. 24 & 26 Fremont Street.

—MANUFACTURE—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangments will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

IMPROVED WATER-WHEEL,

—PATENTED BY—

John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

To Druggists and all Prescribing for Neuralgic and Nervous Cases.—Your attention is called particularly to the efficacy of WATTS' NERVOUS ANTIDOTE for the above. Feelings of humanity, independent of pecuniary considerations would prompt you to recommend it in all cases of Neuralgic Pains Face Ache, from defective teeth, and the General Wasting Away and Debility of the Nervous System, if you could have the assurance that this was what it is purported to be—THE GREAT RELIABLE TRANQUILIZER AND RESTORER OF THE SYSTEM. It has been repeatedly prescribed in cases of excessive drinking, on the verge of Delirium Tremens, and even while laboring under its distressing influence, with astonishing results. It contains no preparation of Opium or Valerian, and is never accompanied with the unpleasant sensation always experienced after taking successive doses of them. It is also the best Soothing Syrup in use. Patients have taken Watts' Nervous Antidote many months in succession, and experienced no unpleasant effect whatever—while the same continued use of many other popular remedies has completely shattered the system.

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3¾ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep21

WHEELER'S
Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

☞ These Pans may be seen in daily operation at the Miners, Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

LLOYD'S NEW AMALGAMATOR
Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $10 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 6 0 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 65¼ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold	$73 33
Silver	42
To the Ton	$73 75

The assay being made by Messrs. Molitor & Co.

From 2 pounds of the same ore, worked for the same party, was obtained:

Gold	$63 30
Silver	04
To the Ton	$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 34.4 per ton; and over the works at the mill, $62 51.2 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $4.19, Silver, $1.52, amounting to $2.71-00—equal to $361.33-00 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $ 54 to the ton—the difference in favor of Lloyd being $207.35-00 to the ton.

Result of 68 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for G. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 6,18-100. Assay made by Messrs. Molitor & Co. 100 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58-00—equal to $101.60 to the ton. Difference in favor of Lloyd being $74.58-00 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustell Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. etween 3d and 4th.

A. S. HALLIDIE & CO.,
WIRE ROPE MANUFACTURERS.

Established 1857.

Office, No. 412 Clay street—Works, North Beach, SAN FRANCISCO.

After seven years' use throughout the State of California and the Pacific Coast generally, we can confidently recommend Wire Rope for

HOISTING FROM DEEP MINES,
GUY ROPES FOR DERRICKS, &c.,
STANDING RIGGING FOR SHIPS,
FERRY ROPES FOR FERRIES,
SASH CORD FOR WINDOW SASHES,
ETC., ETC., ETC., ETC., ETC., ETC

It being Cheaper, Stronger, Lighter and More Durable than any other kind of Rope, and not stretching or shrinking by atmospheric changes.

MINING COMPANIES, by using it for Hoisting Purposes, save 66 per cent. on their outlay for other ropes.

Wire Fencing Strand,

For fencing large parcels of land—permanently, economically and expeditiously. Manufactured in any length desired.

Pamphlets containing weight, strength and price, forwarded free application to the Manufacturers.

WIRE SUSPENSION BRIDGES AND AQUEDUCTS

We are prepared to erect, of any span and capacity, and take pleasure in referring those interested to the many structures of this kind built by us in California, Oregon and British Columbia, of span from 200 to 400 feet. 3-3m

By order of the Board of Trustees.

J. P. VAN HAGEN, Secretary.

Office, No. 302 Montgomery street, No. 7 and 8, 3d floor.
San Francisco, May 26, 1864. 22-2t

Cocheco Gold and Silver Mining Company, Office, 625 Clay street, San Francisco, California. Location, Humboldt District, N. T.

Notice is hereby given that in accordance with an order duly made by the Board of Trustees of the Cocheco Gold & Silver Mining Company, there will be sold at public auction at the Office of the Company, on Monday, May 30th, 1864, at 12 o'clock, M., to the highest bidder for cash, in U. S. Coin, so many shares of the Capital stock of said Company standing in the names of the hereinafter mentioned stockholders, as will be necessary to pay all assessments now delinquent thereon, together with cost of advertising and all accruing charges, unless the same be previously paid.

And in accordance with law, and an order of the Board of Trustees made on the 24th day of May, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on Wednesday, July 6th, 1864, at 12 o'clock M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

J. F. MILLER, Secretary.

Office, No. 416 Washington street, San Francisco.

Suerte Copper Mining Company, Carman Island.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held May 24th, 1864, an assessment of twenty-five cents per share, was duly levied upon the Capital Stock of said company, payable May 25th, 1864, in U. S. Gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of June, 1861, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 11th day of July, 1864, at 12 o'clock M. to pay the delinquent assessment and costs of advertising and expenses of sale.

By order of the board of Trustees. ISAAC TABOR, Sec'y.

22-4t Room 7, No. 502 Montgomery Street, San Francisco.

Adelaide Consolidated Silver Mining Company,

Colorado District, El Dorado Canon, Territory of Arizona. Office, 620, Washington street San Francisco.

NOTICE is hereby given that in accordance with the laws of the State of California, and in pursuance of an order of the Board of Trustees of the Adelaide Consolidated Silver Mining Company, duly made, May 23d 1864, there will be sold at auction at the office of said company, on the 27th day of June 1864, at 2 o'clock, P. M., to the highest bidder for cash in U. S. coin, so many shares of the capital stock of the company standing in the names of the following parties, as may be necessary to pay assessment No. 2 and 3 of fifty cents each, and levied by the Board of Trustees, August 27th, 1863, and December 12th, 1863, and, also, balances and other dues as specified herewith, together with all charges accruing from advertising and sale, unless all such dues are previously paid to the Secretary,

And, in accordance with law, and an order of the Board of Trustees, made on the 25th of April, 1864, so many Shares of each parcel of said Stock as may be necessary, will be sold at the Salesroom of Jerome Rice & Co., 327 Montgomery street, San Francisco, on Wednesday the 15th day of June, 1864, at the hour of 11 o'clock, A. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

D. B. FRANCIS, Secretary.

22-2t Office, 509 Clay Street, San Francisco.

Rubicon Gold & Silver Mining Company No. 4.—Keyes District, Owens River, Mono county, California.

Notice is hereby given that in accordance with the Laws of the State of California, and an order duly made by the Board of Trustees of the Rubicon Gold and Silver Mining Company, No. 4, there will be sold at Public Auction, to the highest bidder for cash, in United States Gold Coin, on the 17th day of June, 1864, at 11 o'clock A. M. of that day, at the office of the Company, No. 7 and 8 third floor, No. 302 Montgomery street, San Francisco, so many shares of the Capital Stock of said Company standing in the names of the following persons, or shareholders, as will be necessary for the payment of Assessment No. 5 of ten (10) cents per share, duly levied thereon April 18, 1864, by the Board of Trustees, together with the expenses of advertisement and sale, unless said assessment and accruing charges are previously paid.

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of April, 1864, so many shares of each parcel of said stock as may be necessary will be sold, at the auction room of Jno. Middleton & Son, No. 401 Montgomery street, San Francisco, on SATURDAY, the 4th day of June, 1864, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

H. B. CONGDON, Secretary.

21-3t Office, No. 620 Washington street, Room 3, San Francisco.

United States Gold and Silver Mining Company.— Mine located in Lander county, Nevada Territory.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 1, levied December 23d, 1863, of three cents per share, and Assessment No. 2, levied February 6th, 1864, of five cents per share, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Shares.	Amount.
ASSESSMENT NUMBER ONE.		
E Lashier,	400—not issued	$12 00
J S Schuster,	332—not issued	9 96
George Baumer,	334—not issued	10 02
Henry Schulz,	334—not issued	10 02
D B James,	100—not issued	3 00
D Tourtellotta,	200—not issued	6 00
ASSESSMENT NUMBER TWO.		
Fisher M Clarke,	400—not issued	20 00
F Lashier,	400—not issued	20 00
R R Fuller.	334—not issued	16 70
J S Schuster,	332—not issued	16 70
George Baumer,	334—not issued	16 70
Henry Schutz,	334—not issued	16 70
D B James,	100—not issued	5 00
D Tourtellotta,	200—not issued	10 00

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of May, 1864, so many shares of each parcel of said stock as may be necessary will be sold, at the auction rooms of John Middleton & Son, No. 400 Montgomery street San Francisco, on MONDAY, the 20th day of June next, at 12 o'clock M. of said day, to pay the delinquent assessments thereon, together with costs of advertising and expenses of the sale.

T. L. BIBBINS, Secretary.

Office, No. 302 Montgomery street, San Francisco.
San Francisco, May 20th, 1864. 21-5t

Eureka Mining Company, Mineral Spring District, Calaveras County, State of California.

Notice.—There is delinquent, upon the following described Stock, on account of Assessment levied on the 12th day of April, 1864, the several amounts set opposite the Names of the respective shareholders, as follows:

Names.	No. Cert.	No. Share.	Amount.
D T Brown Jr	51	10	2 00
Chas S Nathan	37	5	1 00
Antonio Rose	119	10	2 00
Antonio Rose	131	10	2 00
Antonio Rose	152	20	4 00
Jesse Thompson	100	10	2 00
Jesse Thompson	101	10	2 00
Jesse Thompson	102	10	2 00
Jesse Thompson	103	12	2 40
Jesse Thompson	127	20	4 00

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of April, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the office of the Company, on the 30th day of May, 1864, at the hour of 12 o'clock M, of said day, to pay said delinquent Assessment thereon, together with costs of Advertising and expenses of the Sale.

C. W. HAYDEN, Secretary.

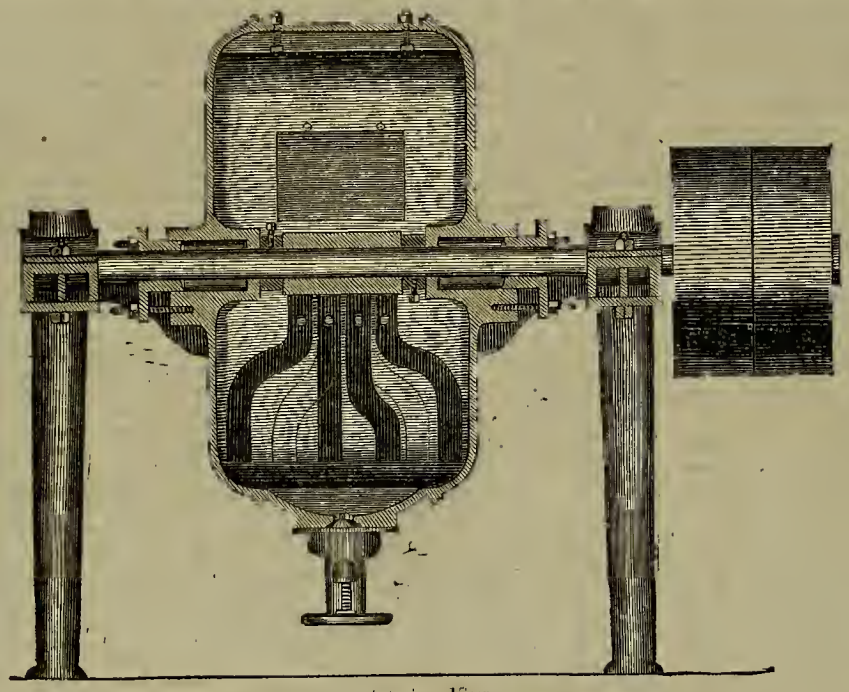
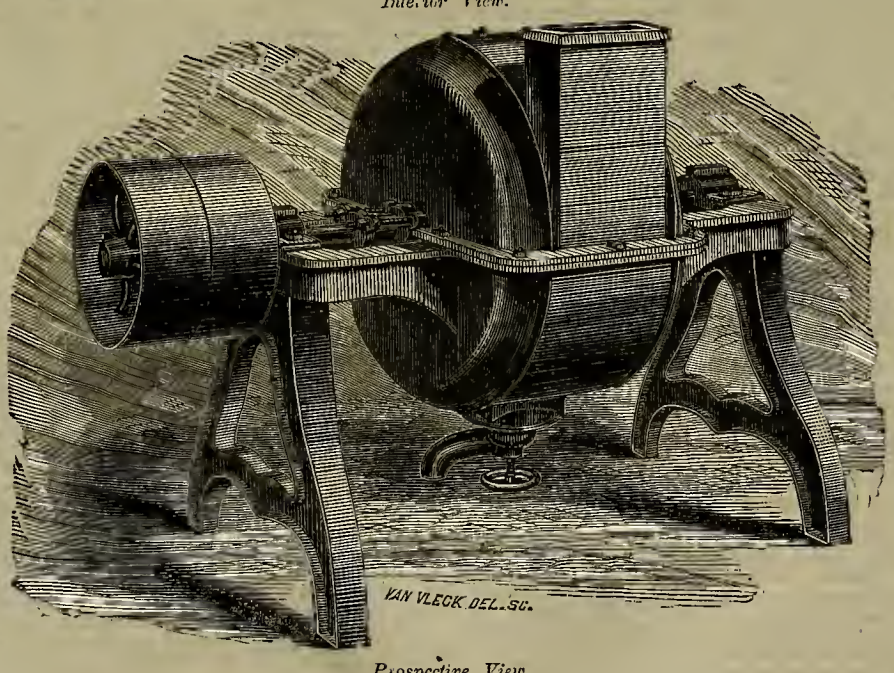
VOLUME VIII. SAN FRANCISCO, SATURDAY, JUNE 4, 1864. NUMBER 23.

HOWLAND'S CYLINDER AMALGAMATOR.



Interior View.



Prospective View.

This Machine consists of a stationary cast-iron cylinder, into which the pulp is placed, and within which is caused to revolve several arms or stirrers, as is seen in the lower figure. Two or three sets of arms are affixed to the revolving shaft, as is shown in the lower figure, one set being in sight, and the position of the other set being shown by the outline between; the two being so arranged, that the second set, as it comes around, strikes the pulp in a different place from that occupied by the previous one, thus ensuring a thorough and complete agitation of the entire mass. The principle upon which this machine works is the same as that of the Freiberg barrel. In the latter, pieces of soft or wrought iron are placed loosely with the pulp, and the cylinder or barrel is made to revolve, thus producing the necessary agitation. In this machine the cylinder is stationary and the agitation is effected by the arms as above described, which are made of *wrought iron*, in addition to which a bar of wrought iron is also bolted to the top of the interior circumference of the cylinder. The chemical action, of course, is the same in both. The machine is discharged through a convenient opening at the bottom, as shown in the cut.

This machine undoubtedly possesses many advantages over the Frieberg barrel in point of economy, both in time and wear. We are informed that the cylinder amalgamator will accomplish its work in one quarter of the time required by the barrel, and at a much less expense of power. The original cost of the cylinder is but a trifle, if any greater than the barrel, when placed in its frame ready to receive power. The cost for wear and tear in the iron cylinder is also much less than that in the barrel. We understand that this machine is now being introduced into mills in Washoe, Esmeralda and Reese River. It is manufactured at the Miners' Foundry, in this city; Mr. Howland, one of the proprietors of the foundry, being its inventor.

The Chemistry of the Process employed by this machine may be stated as follows:—The ore being roasted with common salt, has all its silver, copper, lead and antimony converted into metallic chlorides. These chlorides are, in turn, converted into the metallic state by the action of the iron—the iron itself *becoming* chloride. The copper, by the roasting, is converted into the deuto-chloride, and subsequently by the action of the iron, is partly converted into the proto-chloride of copper, and partly to the metallic state, which latter portion of the copper, precipitates the silver in a metallic form. If the mercury is present in sufficient quantity, all the silver, lead antimony and copper is taken up in the form of an amalgam. If sufficient iron has not been added before adding the mercury, or if it has not been worked with the ore long enough to convert the deuto-chloride of copper into that of the proto-chloride before adding the mercury, a loss of mercury will take place, because it will act upon the undecomposed chloride and become calomel. The heat engendered in the process is due partly to the chemical action going on in the mass and in part to the friction which is produced.

The population of Canada is reported to be 2,506,735.

Written for the Mining and Scientific Press.]

THE FORMATION OF METALLIC VEINS.

NUMBER VI.

BY EDWARD A. MILES.

The entire theory the writer has outlined, concerning the formation of metallic veins, is the only one he can consistently adopt to explain all the peculiarities of several hundred mineral veins that have come under his particular notice during the past five years. For a long time firm in the commonly-accepted belief in the igneous origin of most veins, he continually encountered facts difficult to explain by any such hypothesis, until those facts caused him to frame a chemical theory, wherein he enconntered better success. But still finding simple chemical action insufficient to render many things conformable, he, finally, about a year ago, fixed upon electricity as the secret power of metallic production, and during an extended prospecting tour of eight months in Nevada Territory, directed his attention to every fact seemiag to afford proof or denial of such a theory. He is confirmed in his helief hy the possession of quite au array of facts sustaining those already advanced in respect to the mines of California and Nevada Territory. Since committing the theory to paper, several months ago, the writer has sought all the information readily ohtainahle conceruing the mines of other countries, and finds that the same general laws of construction are impressed npon them all, and that these, as well as their variances, can only be plausihly accounted for hy electricity as the one chief cause. The suggestion of electricity as an agent of mineral creations, has been briefly put forth by several scientific authors; hut only lately, in his research, did the writer become aware that there had heen any attempted demonstration of electricity as the great cause above all others. It appears that as long ago as 1838 a scientific paper was puhlished in England hy R. Were Fox, Esq., the same who first experimentally detected electrical currents in veins, seeking to trace the formation of veinstone and the introduction of metals to electricity. After claiming to have put forth the idea in 1822, he says: "In 1827, I again alluded to the suhject and to the apparent analogy hetween the geuerally prevalent direction of the principal metallic veins nearly at right angles to the magaetic meridian. Between two and three years afterwards, I commenced my experiments on the electro-maguetic properties of the metalliferous veins, and proved the reality of the existence of electricity in them."

Mr. Fox, heyond all doubt, is entitled to the merit of the suggestion; hut, aside from the application of his theory to the formation of veinstone and the faults and local peculiarities of the Cornwall mines, he did not attempt to render the said theory coaformable with the various peculiarities of other mining sections and the extended laws of electricity, nor did he assign any positive source to the metals, without which the electrical cause cannot expect general credence. From the fact of beiag ahle to cause fissures, as well as small veins of zinc, in masses of moist clay by the lengthy action of galvanic currents, Mr. Fox rather weakened his theory at the start by assuming that many of the fissures containing veins were originally produced hy electricity, after the surrounding rocks had secured their present positions.

In regard to veins that have come under the writer's observation, it is more compatihle with kaown effects and appareat causes to consider most fissures across cleavage planes and in solid masses of rock as mechaaical results, necessarily caused either hy the distention and cooling of the eruptive dykes, or, in case of crevice veins in a general formation, through the hending of the strata hy an uplifting force beneath. It is very apparent, however, that the electro-chemical power is often active in extending veins and their spurs; pre-created fissures heiag the hasis of the action. Proceeding upon the decidedly donhtful hypothesis of great heat in the interior of the earth, Mr. Fox suggested the phenomenon of deep fissures holding a dowaward flow of cold water and a returniag stream of hot water assisting in the filling of the same, hy causiag infiltration of earth and masses of rock from ahove and chemical deposition from below; the electricity aiding the decomposition and accumulation. As hearing on this point, he noticed a difference of temperature in the slate and the granite at similar levels, the former being one or two degrees warmer, and the fact that Fournet, a French geologist, had observed in the mines of France proof of the progressive enlargement and filling of fissures. Heat may be truly considered as one of the effects rather than the cause of the later electro-chemical action in veins. It is not true tbat more than a comparatively small number of veins are connected with deep fissures; aud wbile eruptive rocks have in many cases assisted with their heat in the formation of veinstone, there are veins, such as those of galena in limestone, where no great euergy of heat ever existed, although undouhtedly present iu the electrical changes. Again, Mr. Fox committed the error of contending that the prevalent direction of the principal Cornwall veins, "at right angles to the magnetic meridian," is a strong proof of the electrical creation, whereas the principal veins in other portions of the world have different directions, regulated seemingly hy their geological surroundings. Extending his tbeory to the consideratioa of the faults, division and other local peculiarities of the Cornwall veins, Mr. Fox gave many strong proofs of the electrical agency, hut not exactly of the assigned modes of action. He states that where veins cross each other at right angles but one is rich, and that the favored veins always have the same set direction. This influence of direction among a compound series of veins the writer had occasion to notice not long since, and considers the enriching of certain chosen lines of flow a good argument in favor of the electrical operation. Mr. Fox succeeded in producing sulpburets of copper hy the lengthy treatment of other forms of ore with a galvanic current; an important experiment, cousidering the great difficulty of hringing ahout the accomplishment of the same result hy any other process within human control.* Mr. Henwood, a coadjutor of Mr. Fox in the experiments concerning the electrical currents of veins, disparaged the idea of any regularity in said currents or their prominence in the creation of veins, alleging that the currents were alone detected in tbe metallic parts of veins, and greatest where heaves or faults occurred. As the inteasity of electrical currents affects not the needle of a galvauometer, it is hardly supposable that the delicate quantity atomically set free in veins will always overcome the directioual state of the magnetic needle. It is the best evidence that such currents really do exist, that they should he manifested where faults or such iutrusive ores cause differeut relations of conduction.

Ahout the tiue Mr. Fox's theory was pnblished, electricity was having an immense run of popularity, and extravagant predictions and anticipations of the immediate and wonderful effects of its power frequently indulged, until check-mated by a realization of the impenetrahle harriers which its first principles present even to this day. Mr. Crosse managed, by many mouth's action with galvanic batteries, to produce from powdered material quite perfect crystals of minerals similar to those found ia nature. Not oaly the lamination of rocks hut also the separation of different mineral elements such as clay, lime and saud in strata was ascribed to the same cause.

Tbe writer has thus particularly referred to a long-promulgated and almost forgotteu theory in order to do justice to oue who first recognized the agency of electricity in metallic veins. Having unconsciously arrived at the same general conclusioa, hy an entirely independent series of investigations, tbe writer is pleased to find his own views fully sustained hy all the facts stated by Mr. Fox in his paper.

It may he asked what benefits will accrue from a complete substantiation of the geaeral distribution of metals in the earth and of the agency of electricity in veins? To this it may he answered that:

1. By dissipating the doubts concerning the origin of veins, every failure in working them will become a sure and profitable lesson to guide future operations of the kiad in all parts of the world.

2. By a mineralogical and geological examination and chemical analysis of the surrounding rocks, it can he discerned what metals impregnate the differeat veins, and hy the exteat, apparent energy, etc., of the operating influence, the approximate amount of the metals within their walls can he determined.

3. A large number of veins, poor in the aggregate of rock, may be made to yield a working profit hy a close stady of local positions and parts.

4. The working of metallic lodes will he placed upon a safe and profitahle hasis hy the clear adaption of known laws; the persons aud communities interested in them euriched; extravagant and feverish anticipations froai superficial evidences in mining regions prevented from sapping established prosperity; frenzied, periodical tides of mining excitement stemmed at the fountain heads or made impassable, and a conscientious spirit of rectitude restored to every social and husiaess circle of our State.

*It is said that sulphurets have been produced by a discharge between a plate of sulphur and a metallic disk.

[Written for the Mining and Scientific Press.]

From a Special Correspondent.

THE NEWTON MINE.

Five miles east of Ione, in a ravine, through which passes the Jackson road, I came to the mine of the Newton Co., comprising 1,800 feet of ground. There are two shafts sunk on the vein, one hundred yards apart. The most southerly one is seventy feet in depth, and the other, close heside the road, one hundred and eighty feet. Guided by Mr. James Guylas, the Superintendent of the miae, I descended the ladder of the main shaft, which opening is four by six feet in the clear, and strongly aad neatly timhered. We stopped occasionally to examine rich bodies of ore and peculiarities of the vein, not forgetting to admire the symmetry of shaft, in which my guide, who, from his eighth year to advanced manhood, has delved beneath the earth's surface, seemed to take special pride. At the depth of 70 feet we came to the place where the copper was struck hy the first shaft. This prospecting shaft started down along the foot wall ia a heavy deposit of mundic, and at the depth named, a drift was carried eastward toward the hanging wall. After passing through ten feet of mundic, a good vein of copper ore was struck. Since then the old shaft has been filled up, and another one opened and continued down on the east side of the mundic, at an angle of 80 degrees. At the depth of 160 feet, we passed into a drift leading northward 30 feet along the vein. Here I was enahled to fully examine the construction of the vein. The mundic—a much fiuer grained deposit of iron sulphurets than that of the English mines—lies against a foot-wall of clay slate, and is supposed to retain a general width of ten feet, though usually hut little penetrated or removed. It possesses a nearly perpendicular slaty fracture and a rolling or uneven face. Next eastward of the mundic comes the vein of ore, here averaging a width of ten iaches, but narrowing and enlarging with the contour of the muudic, which appears to control the size of the vein without regard to the hauging wall. Between the line of ore and the hauging wall is a vein of cream-colored magnesian clay, about the hardness of chalk. This varies from six inches to two feet in thickness, and is technically termed hy the miners "the gorge." It is sometimes associated with a little fluccan, a soft, creamy mass, which, in the Cornwall mines, entirely occupies the place of this "gorge." The hanging wall is a hard, glossy mass of serpentine. Thus there is hetween the walls three distinct strata, filliag a width of ahout 15 feet and dipping regularly eastward. Crossing the shaft, we entered another drift, passing southward 200 feet. At the distaace of 160 feet, the mundic, after dwindling to a mere point on the foot wall, entirely disappears, while the serpentine, with a curved line of vertical cleavage, here closes across the vein of ore, which gradually grows more narrow, changes in character, and finally merges into solid quartz at the end of the drift. The vein at this end assumes an inclination nearer perpendicular. Retracing our steps ahout three-fourths the length of the drift, we scaled the smooth walls and slippery timhers of a shoot, some 30 feet, to the upper line of stopeing, or point up to which the ore had been extracted, and wormed our way through several narrow places and over otber shoots. Ia cautiously advaacing over the more perilous places, I received aid from my stalwart guide, and confidently followed literally at his heels. Reaching the extreme southern limit, we next returned northward, and proceeded within 12 feet of the shaft. Through a distance of 150 feet, where for an average height of 25 feet from the top of the lower drift the ore had been extracted, we closely examined overhead an unbroken liae of copper sulphurets, ranging from one to two feet ia width. Lengthy views of this vein of ore, distinguishable by cross fractures and black exteraal oxidatiou, gave an impressive sense of the wealth of this mine. In the lower drift, I satisfied myself that the continuous vein possesses a length of at least 230 feet. In traversing the line of stopeing, we came to a singular freak of the mundic, where, proceeding southward, it had suddenly raised to the perpendicular hight of 18 inches, gone about the same distance on the new level, and thea again leaped an equal distance to its eventual plane, thus formiag two distinct steps, extending up and down the ledge as far as discernable. When the workmen reached this singular place they for a time thought that the vein of ore had stepped out. Returning to the shaft, we concluded not to attempt the remaining 20 feet of

depth, which is being extended as fast as such work can progress with only four men about the mine. Reaching the surface, we next examined the outside of the southerly shaft, the sulphurets of which appear to be of a low grade and mixed with carbonates. The selected sulphurets of the entire vein rarely exceed a value of 14 per cent. Twelve hundred tons of ore have been shipped up to the present time, constituting the full product of the mine, unassorted. For the sake of concentrating the second class ore, resort has lately been had to roasting, for which purpose it is contemplated to erect suitable furnaces. The shaft is enclosed by a building, and the hoisting is done with a whim.

OTHER MINES.

Five hundred feet south of the Newton ledge, on the same vein, is the claim of the Oak Hall Company, with a shaft down 108 feet, and drifts in search of the vein summing up a length of 90 feet. The expenditures have amounted to some $5,000. At present, the claim is idle.

Three miles south, on the Newton vein, is the shaft of the Ione Co., 100 feet in depth, and for the last 60 feet possessed of a small vein of low grade ore. No work going on.

There are two or three claims being prospected at the present time between the latter claim and the Mokelumne river; the names I did not learn.

One and a-half miles north of the Newton claim, on the Dnty vein, is the claim of the Rutledge Co., commonly known as the Richardson ground; shaft 250 feet deep, in sinking which about five tons of ore were taken out. The total expenses have not exceeded $4,000, mostly borne by a contractor, who agreed to prospect the claim, and receive an interest in payment of his work.

A quarter of a mile south of this claim, on the Hornblende vein, which lies between the Dnty and Newton, is the claim of the Randal Co., with a shaft 130 feet in depth.

In this cursory view of the copper mines of Amador county, I have only attempted to briefly notice the condition and progress of those in best repute, together with a few others considered undeveloped, as samples of the expectations and expenditures of this branch of mining. Had I done more than this, I would have shown greater interest in the various claims than the owners at present choose to accord them. A little more than a year ago, a strip of country about five miles in width and fifty in length, between the American and Mokelumne rivers, was being investigated by a host of prospectors for copper. To-day, scarcely a dozen men outside the claims herein mentioned are thus employed. Business men, ranchmen and others lament the stringency caused by investments in copper mining, but hopefully look forward to a time when further developments of the opened and prospective mines shall bring individual profit and bustling communities of connected interest.

Your compositor last week illustrated me as crossing a "rude bridge," instead of "wide ridge," as written. M.

SILVER IN AUSTRALIA.—Silver mines are being discovered to a considerable extent in Australia, and are beginning to afford quite a promising yield. Late advices report "a silver Cornwall" at St. Arnaud, in the colony of Victoria, out of which the English journals are prophesying new elements of Australian prosperity, and new and important commercial enterprises. Like the gold discoveries in that region, so have these new silver discoveries been prompted by the wonderful developments of that mineral in Washoe. An association is contemplated in London to explore and work this new field of enterprise with every appliance which English experience and capital can bear upon it. The London *Times* is rather inclined to complain that their geologists and scientific men have not made the discovery at an earlier day, and suggests that lost time on the part of these gentlemen by an early preparation of a suitable works, popularizing information as to the true indications of silver deposits in mineral regions, and the best method of searching for it—one that shall be a guide to the miner abroad and at home, and be of universal benefit. Even with reference to home mining districts in England, it is intimated that the doubt might not, after all, be so inadmissable that argentiferous product has been too long overlooked in the zealous search after grosser, but not less useful, minerals.

RUSSIA gets $20,000,000 of gold a year from the Ural mountains.

(Written for the Mining and Scientific Press.)

Amador District, Reese River.

EDITORS PRESS:—It is a pleasure to know that there is a newspaper as ably conducted as the MINING AND SCIENTIFIC PRESS, whose special effort is to enlighten this and other communities in regard to the singular and enormous wealth of this State and the adjacent Territories. I believe you welcome from all sources intelligence concerning the new and promising developments of mines, whether of copper, silver or gold. While every day new districts are brought into notice, the public will acknowledge they are not fully acquainted with some of those less recently discovered. It is not a year since the first pick was struck in the ground for the actual and thorough prospecting of the resources of the country in the district lying about eight miles distant from Austin, Nevada Territory, called the Amador Mining District. The first mine discovered and located in that section was the Coral, concerning which, with some of the adjacent claims, but little information has been given to the public, lest a premature reputation might be given to the same, which might not be sustained after developments. The vigor with which work upon the Coral has been prosecuted has, up to this time, amply repaid all expectations, and the owners of other claims may thank that company for their energy in determining as soon as possible the fulfillment of the promise which earlier indications gave. It has been to that company, however, a tedious and anxious undertaking, for they have met the same varied fortune which has heretofore attended the companies working the North Star, Oregon, and several lodes of like character, situated in the district nearer the town of Austin, the owing to the upper portions of the hills carrying with them the crowns of the lodes. In brief, like them, the Coral Company has sunk its shaft upon the lode; has found that it has slidden with the hill; has run a level following a seam, which was their sure guide; has lost it again; has still pursued its way, persistently following the guiding seam over their heads, until they have finally, a few weeks ago, found the main ledge, beautifully defined, with "walls from which the quartz cleaves off, leaving them as smooth as glass," and the character and width of the lode demonstrates, in a great degree, what may be expected of others in that vicinity. The greater width of the mines in the Amador district at once, upon their discovery, drew attention away from the Yankee Blade and Reese River districts for awhile; but the croakers, who came in a little slowly to find all the promising claims located, prophesied that if they were wide they couldn't be very rich. They have little to say, however, now, when the Coral, with a lode of six feet wide, has already shown a handsome stratum of the dark blue sulphurets of silver, which have given a merited reputation to the North Star and Oregon. The greater depth attained in the Coral than in any other mine in the district, has already given assurance of the wealth which will undoubtedly be confirmed by the much greater depth at which the Amador Tunnel, when completed, will strike their lode. Upon the Coral's success, other claims may predicate a like good fortune, as the Zaidee, the next claim above the Coral, which already offers, in rich assays, unmistakable proof of a valuable deposit below. Rough and Ready is situated in the immediate vicinity, and only needs a vigorous prosecution of labor to show a handsome deposit, while Old Hickory and others near these mentioned will undoubtedly take place near the best veins in this district of incomparable promise.

SILVER IN BUENOS AYRES.—In the Argentine Republic, province of San Juan, and at the foot of the Andes, 700 miles distant from Buenos Ayres, a rich silver-bearing region of immense extent has recently been discovered. An area of 100 miles by 40 has already been prospected, and, wherever worked, a yield rarely surpassed in quantity and quality by any other district has rewarded the adventurers, whose labors are facilitated by smelting works, with the best English machinery, being already erected on the spot for the reduction and refining of the silver.

IMPORTANT DISCOVERY—Dr. Richardson an English chemist, claims to have made the discovery that iodine placed in a small box with a perforated lid is a good means of destroying organic poison in rooms. During the late epidemic small-pox in London, he saw the method used with benefit.

(Written for the Mining and Scientific Press.)

From El Paso.

EDITORS PRESS:—I am happy to be able to state that the Yarbrough Company have arrived with a force of practical miners and six months' provisions to prosecute the tunnel through Mount Ophir and develop its contents, and that company have the backing to fully carry out any enterprise they may undertake.

The Newton Company are progressing favorably, and intend to double their force as soon as help can be obtained.

The Rochester Company gave up their arrastra during the winter, owing to the continued coldness of the nights, which froze the pulp, and also prevented the free action of the quicksilver. This, together with the high cost of feed—barley 10 cents per lb. and hay $100 per ton—was more than the yield would warrant. They are now sinking on a copper lead at the head of the district.

Your popular and valuable journal reaches us quite regularly, and gives universal satisfaction. From every column the miner can gain useful and practical information.

We have been much chagrined by a full report received per last mail, of the swindling operation of one H. G. Boing, who spent some months of the past year in locating and recording claims and extensions in this region, without doing any work to hold them (with one exception), and then selling out to various parties in San Francisco and vicinity and skedaddling to parts unknown. His former partners have suffered over $200 by him pecuniarily, and two or three in San Francisco about the same, and sundry others in less amounts. We deplore the tendency such conduct may have to prejudice the reputation of our district, as all those who have been swindled will be likely to give us more curses than blessings. C. W. TAPPAN.

EL PASO CITY, May 17, 1864.

A CURIOUS DISCOVERY has recently been made regarding the influence of iron on vegetables. Preparations of iron are used as medicine where the blood is poor in red particles. The pale cheeks of the invalid often regain their bloom under the influence of such tonics. It is the same, it appears, with plants. On the chalky shores of France and England, where there is an absence of iron, vegetation has a sere and blanched appearance. This is entirely removed, it appears, by the application of a solution of sulphate of iron. Haricot beans watered with this substance acquired an additional weight of sixty per cent. Mulberries, peaches, pears, vines, and wheat, derive advantages from the same treatment. In the cultivation of clover, wonderful advantages have been gained by the application of the sulphate of iron on soils in which that ingredient is wanting, and in cases where it is desired to produce an early crop. The material is of course cheap, and the quantity applied small. All the scales falling around the blacksmith's anvils should be saved for the land—they are worth five cents a quart to gardeners. No fruit is so much benefitted by iron rust in the soil as the pear.

SINGULAR COMMERCIAL TRANSACTION.—At the present time very little freight is offering in the Eastern ports for Europe, while there is a large demand on the other side for transportation for passengers to this country. New York ship owners have thus entered into competition for freight eastward, to an extent, in at least one case, according to the New York *Express*, of offering a bonus for the purpose of taking a load of wheat over for nothing; the ship owner even to pay all charges for loading and disembarging! Of course the shipper needed the grain for ballast, which he would otherwise had to have bought at a greater expense. This transaction is probably without a precedent.

PELTRIES—Three hundred and seventy beaver skins and sixty otter hides, says the Stockton *Independent* of May 24th, were sent to the Bay by the Hensley, yesterday afternoon. Dykeman captured 190 of the beaver and 36 otter in the tules in a little less than two months time. Levi Phillips secured the balance. The price of the skins ranges from ninety cents to a dollar each.

Mining Gossip.

EDITED BY.....FRANK WARDELL.
FOR THE MINING AND SCIENTIFIC PRESS.

STARTLING.—We may well use the expression which heads this item when we consider the manner in which Gould & Curry, and in fact almost all the leading stocks "tumbled" in the different stock boards on the morning of the 28th inst. It was startling, indeed. Stocks were low enough before this crash, but when we wituess such a line of stock as Gould & Curry "knocked" without the least particle of mercy by the hulls and bears down to $3,400, we came to the conclusion that it would not do to bet on anything in this mysterious nge. Now, we argued, if Gould & Curry falls, it will, as a matter of course, hring all the other stocks down with it, and what little confidence is left in operators will soon he entirely lost, and the market will consequently he dead for some time to come. Facts thus far fully verify our surmises. We have tried to ascertain the cause of the fall in Gould & Curry, hut we gain nothing definite; it is all outside talk. Some say that the sale in the first instance was a forced one, it heing the stock of a party who had horrowed money upon it, and the loaner demanding his money, the horrower not being ahle to replace it in time, the stock was shoved in the market. Another says the mine does not look as well as it has done, that the rock is not of as good a quality as heretofore. On the other hand, another avers that the mine has never hcen in a hetter condition than at present, that they have taken out $60,000 more during the past month than the previous one, and he thought the divideuds this month would he $150 instead of $125, and what should cause the stock to drop in the market was something that he could not comprehend. Thus it goes. All thiuk they know the cause, and when you come to sum up all you have heard, it is one hatch of contradictions. We are in the dark, and if any of our readers have the "points" they will confer a favor by enlightening us.

THE BOWIE KNIFE.—It is said that one Black, the first manufacturer of the Bowie knife, is the only man who possesses the secret of making and hardening these knives so as to render them equal to the original. His mode of testing them was to lay a half-dollar upon a hlock, and with ono stroke of the knife cnt it in two. If it performed the work the knife was all right; if it turned or hacked the edge, he would coademn it. According to the Nevada *Gazette*, which paper derives its information from parties well acquainted with hoth Black and Bowie, the first Bowie knife was made out of a common hlacksmith's rasp, hy Black, from a pattern whittled out of a shingle hy Bowie, with his jackknife. The manufacture of thnt pattern was the only connection which Bowie ever had with the knife, except to give his name to it and slaughter several people with the first knife made as above. This ideuticnl knife, it is said, was on exhibition at the late New York Sanitary Festival.

HARMON G. ANN S. M. Co.—At an election of officers the following gentlemen were elected for the ensuing year:—Benjamin Dore, President; J. E. Kincaid, W. D. Litchfield, J. W. Cullen, W. H. Davis, H. Rosekrans and E. D. Waters, Trustees; C. W. Moulthrop, Superintendent, and Benjamin Hall, Secretary.

ANOTHER NEW COIN—The new two-cent pieces will soon he in circulation at the East, hearing, on one side, "United Stntes of America—two ceats;" on the reverse, a shield and words, "God our trust." This is the first one of our national coins which recogaizes the existence of God, in either legend or device.

GOOD RUN.—The American Mining Company, at Sehastopol, Nevada county, after a ruu of twelve days, cleaned up the sum of $25,000.

CONSIDERABLE STYLE.—The new Stock Exchange in New York will he, when completed, one of the hnndsomest huildings in that city. It is said that the contract for the iron work alone has been given out at $230,000. The building when finished will cost in the vicinity of $550,000. This does not look as though the war was any great drawback to business in the East. Greenhacks, from what we learn, are being scattered around "rather carelessly." To give our readers a little idea how some of the brokers have feathered their nests, we will take, for instance, L. G. Jerome, formerly proprietor of the Rochester *American*. His fortuue is estimated at $5,000,000. He has huilt a stable on Twenty-sixth street, at a cost of $40,000. Strangers praise and look at the heauty of the huilding, for over it he has fitted up an elegant private theater. He is uow huilding a house which will cost him $150,000, on Madison Avenue and Twenty-sixth street. In the way of horses and carriages he maintains a splendid *menage*. His personal expenditures are almost royal—$100,000 per aunum. The rise of stocks consequent upon the increase of the currency, has brought up Mr. Jerome as a light-house on the surface of the ocean. A Mr. Morse has also made a fortune of two millions hy a rise in stocks. Of conrse he wants to make people believe he is immensely rich; so, when, a few days since, he rented an office on William street, opposite the Exchnage, he paid his rent, $7,500, three yenrs in ndvance, less the interest.

NOVEL INEA.—Some years ago, when money was extremely scarce in Boston, and haaks would only discount the hest of "gilt edge" pnper, nnd a limited quantity at thnt, a customer of one of the institutions resorted to the followiag desperate expedient to see if there was any such way as raising the wind in said concern. He drew up a note for the sum of five dollars, at thirty days, covered it down the back with first class endorsements from his fellow sufferers, then pinned to it a ten dollar bill of the same hank as a collateral security, after which he ventured to offer it for discount. This so enraged the close fisted directors of the hank that they determined not to deal so close with their depositors, and thus the gentleman aforesaid gained his point, in having his "offerings" discounted without further trouble.

THE LUCERNE Co. are said to be taking oat a very fine description of rock from their claim, the best rock being principally taken from an old shaft, north of their hoisting works. This was suuk to a depth of 120 feet, when water hecoming troublesome a drift was started, which cut the ledge nnd found it twenty-six feet from wall to wall. The rock taken out resembles that which once made this claim so famous.

GOON, IF TRUE.—It is stated that ex-Controller Warren has written to his different hondsmen, sayiug he will refuud the money which they paid for him, so soon as he ascertains the amount, as he has made over $60,000 by stock operatioas in the East. We trust that such may he the case, hut must confess we are very skeptical upon the same.

DULL TIMES.—We make the following extract from a letter received in this city from Virginia City, dated the 28th May:—"Stock business is at a complete stand still; brokers, as a general thing, are on the 'hed rock', and city property is on the tumble at a decidedly disagreeahle rate. The 'greenhack trouhle,' which has heen the leading excitement of the week, has collapsed, and hrokers and speculators in 'wild cat,' are discoasolate. Such is life."

SUSPENNED.—Two promiaent hroking establishments have, during the week, heen compelled to suspend payment. Many more will have to follow in their footsteps if times do not improve.

CONTRACT.—The Washingtou Company, in Alpine county, have made a coatract to run three thousand feet of tunnel in their claim.

PROORESSING.—Pipes have already heen laid down in Austin, for the purpose of supplying that place with water. They extend a distance of 1,700 feet.

Reported Discovery of Tin Near Durango, Mexico.

EDITORS OF THE PRESS:—Having noticed a short article in your late issue in regard to the discovery of a tin mine in Mexico, and having heen requested hy a friend of yours to give the puhlic some information on the subject through your valuahle paper, I avail myself of the opportunity, if I am not trespassing too mnch.

At the time of the war between the United Statcs and Mexico, J. T. Boyd, then a captain in one of the companies of the United States army, was for a long time stationed near the city of Durango, in Mexico. While there he had frequent occasion to go to a certain river (the name of which I do not remember) in the mouutains close hy; and while on those visits, on several occasions he saw the natives drive their pack mules into the river when the water was low and load them up with small houlders, like rock from the bed of the river, aud like most of the American people he had a curiosity to know what they were doing with such houlders. He followed them to where they had a small rude furnace huilt, and saw them smelt out metal which proved to he pure tin. They used it for trimming saddles.

Like all good soldiers he attended to his duties until peace spread its wings over the country, and paid no further attention to the tin mincs. When the gold excitement started in California he came here, and for a time followed mining and farming.—After a while the silver mines in Nevada Territory were struck and created quite an excitement. This discovery set Mr. Boyd to reflecting nhout his discovery in Mexico. When the mines nt Silver Mountain were discovered, he became the owner of "feet" thero, and still reflecting on his tin mine, he thought ho had a better thing than gold or silver; so sometime in the latter part of Novemher or first of December, left the mountains and came to this city to get help to go to Mexico in search of this tin mine. Quite a numher of persons agreed to assist him, taking an interest in the discovery, and actually suhscribed articles to that effect; hut afterwards withdrew their names and suhscriptions, which compelled Mr. Boyd and those that still had confidence in the enterprise, to "change his hase of operations," and another agrcement was prepared, varying somewhat from the first. Several wealthy citizens of San Francisco took au interest in the enterprise, and one thousand dollars was finally suhscribed and paid in. Mr. Boyd, accompnnied hy M. Clayton Hamhly, son of a prominent lawyer of this city, started for Mexico. Arriving at Durango, they immediately set out in senrch of the mine. Proceeding to the river where Mr. Boyd first saw the tin ore, they found it as he left it, seven years hefore. After examining the houlders in the river, and the condition of things there, like good practical miners they proceeded up the river to ascertain where these boulders came from. They had not gone far before they came to a large, well defined and inexhaustable miue, from which they took and packed down a quantity of ore, and in a rude furnace, put in sixty-nine pounds of it and smelted out thirty-three and a half pounds of pure tin, as they inform us here. If no unforseen accident happens to them, that same tin, together with some of the ore that they took from the mine, will arrive here on the next steamer from Mazatlan, when all parties wishiag to see it can have the opportunity.

We are further informed that in the immediate vicinity of the mine, there is an over abundance of good oak timher, for wood for smelting and other purposes. Also a river of pure and limpid water flowing through the mine.

The parties have denounced, taken up and located this mine for the Company, under the laws, rules and regulations of Mexico. The name of the association is the Durango Mining and Land Company.—Many in the city that are interested in this mine, knew all ahout it some time ago, and I should not have writteu this had not the discovery heen made puhlic through your pnper, hut have left it for other parties to have made the announcement on the return of the men from the mine.

Yours Truly, I. S. BROWN.
No. 430, Montgomery street, San Francisco.

LEAN MINES.—During the past year, the lead mines in Virginia, N. T., produced enough for ten millions of ounce halls; nnd the preseat year the quantity will he doubled.

TAXING.—The hill taxing stock dealing is equal to levying five million dollars per annum on the New York Brokers' Board.

The Coal Desulphurizing Experiments at Stockton, of which we made brief mention two weeks since, appears thus far to promise success. The Stockton *Independent* copies our remarks upon the subject, and adds the following further particulars with regard to the experiments in progress :—

The result is now known and is highly successful. Its usefulness in forging iron was tested yesterday by Adams & Howe, and also by Graves & Chism, blacksmiths, Main street, and it was found somewhat slower in producing a welding heat than the bituminous coal imported. From the naturally light character of *lignite* it cannot be expected to equal an article of greater density and weight on the forge hearth; but as an article for fuel in family dwellings we can perceive no good reasons why the light quality of lignite coal procured comparatively near the surface of the ground, should not come into general use after the sulphur is removed. Heretofore, the use of coal brought from the mines at Corral Hollow has been objectionable in two particulars only—the first being the fact that, as a general thing, it is smashed up into the consistency of fine gravel—altogether too fine for use without great labor and waste ; and the second objection has been its almost unendurable sulphuric smell. The latter objection to the coal, is evident, can be completely removed at a trifling cost, and the former will be remedied as the plans and process of excavating at the mines are improved. It is also more than probable that the character of the coal will become more solid the deeper the veins are penetrated, and thereby be better fitted for exciting intense heat, than the quality now found. The experiment of Mr. Keating in depriving the article of its volatile matter—sulphur—does not by any means alter the main substance, so that it can more effectively resist the force of the blast from the forge bellows; neither does it crumble the coal into finer particles, or alter its appearance in the least from what it was before being subjected to the process of desulphurizing, Blacksmiths object to the coal experimented upon, only on the ground of its lightness. A heavy blast will, they say, blow it from the nozzle of the bellows and scatter it on the hearth. But this does not make it objectionable at all for parlor and for kitchen uses. The result aimed at—depriving it of its sulphur—has been reached on a small scale, but by what particular process we have been unable to ascertain. We have the word of the gentleman who has conducted the experiment as authority for stating that the process can as easily and as well be conducted on a scale of magnitude as in the limited form of an experiment. Chemicals and heat are means used; but the particular temperature of the heat applied, or the kind and proportion of the ingredients used, it is not at present in our power to state.

A Water Engine—A California Invention.—Mr. Thomas Hardsbrow, the inventor of the "Challenge Pump," which took the gold medal at the World's Fair in London, has just completed another very important invention, which is spoken of as follows by the Sacramento *Bee:* —

The invention is embodied in the form of a hydrostatic engine—run entirely by the pressure (not volume) of water—works cold water as an expansive agent, and does it most admirably. Messrs. Hansbrow and Redding intend having one constructed for practical exhibition of its workings at the Fair of the San Francisco Mechanics' Institute, to be held in September next. They have now a small tin model running at the store of Mr. Hansbrow, on K street, between Second and Third streets, which, though rudely constructed, exhibits the power of the engine, it being a man's work to stop the motion. It will supersede steam wherever a pressure of water can be obtained. In this respect it will be especially serviceable and invaluable throughout the mining regions of California and the Pacific coast, as well as in our cities where there is a supply of water from public works. The inventors intend building the engines immediately, and introducing them into use. Intelligent mechanics who have examined the rough model unite in pronouncing it the greatest invention of the age, the sewing machine not excepted; and like all great inventions, it is simplicity itself.

Ingenious.—We noticed, says the Gold Hill *News*, an ingenious little machine at the North American claim, the handiwork of the engineer. It is a simple concern which records the number of revolutions which the engine makes. It has the capacity of counting up to one million. It has been attached to the engine less than two weeks, but up to the time we were there yesterday it had recorded 303,115 revolutions which the engine had made during that period.

The Mechanics' Fair.—The approaching Mechanics' Fair is beginning to excite considerable interest among our mechanics generally throughout the State and adjoining Territories. Inventors, particularly, should bestir themselves in season. California can make a better exhibition in that line, considering the age of our community, than any State in the Union. We hope to see every invention which has been brought out in the State, represented on that occasion. Aside from the general interest which will attach to such an exhibition, it will be the best possible advertisement to the inventors. The occasion will doubtless call out an unusual gathering from every part of the Pacific coast. There will be room and opportunity for all.

The Daily Dispatch is the title of an unpretending but pretty little sheet, which made its appearance on Monday last. In its present form it is intended to be devoted mainly to local matters ; but its proprietors, not doubting that their sheet will, ere long, rise to consequence and power, expect soon to enter the arena of general newspaper business. The *Dispatch* is published every evening, at 417 Clay street, by H. Wheelock & Co.

Buried Forests.—Extensive forests, covering valleys and hill-sides, are overturned, and the uprooted trees form a gigantic barrier which prevents the flowing off of the waters. An extensive marsh is formed, particularly well adapted for the various kinds of mosses. As they perish, they are succeeded by others; and so for generations, in unceasing life and labor, until in the course of time the bottom, under the influence of decay and the pressure from above, becomes turf. Far below lies hard coal; the upper part is light and spongy. At various depths, but sometimes as much as twenty feet below the surface, an abundance of hogwood is found, consisting mostly of oak, hard and black as ebony, or of the rich chocolate-colored wood of the yew. Such ancient forests every now and then rise in awe-inspiring majesty from their graves. The city of Hamburg, its harbor and the broad tracts of land around it, rest upon a sunken forest, which is now buried at an immense depth below the surface. It contains mostly limes and oaks, but must also have abounded with hazel woods, for thousands of hazel nuts are brought to light by every excavation, not exactly made for nuts. The city of New Orleans, it has been recently discovered, is built upon the most magnificent foundation on which a city ever rose. It was the boast of Venice that her marble palaces rested in the waters of the Adriatic on piles of costly wood, which now serve to pay the debts of her degenerate sons; but our Venice has not less than three tiers of gigantic trees beneath it. They all stand upright, one upon another, with their roots spread out as they grew; and the eminent Sir Charles Lyell expresses his belief that it must have taken at least eighteen hundred years to fill up the chasm, since one tier had to rot away to a level with the bottom of the swamp before the upper could grow upon it.

Tides of the White Sea.—The question as to the existence of a diurnal periodicity in the tides of the White Sea may now be considered as decided in the affirmative; for we find in the last number of the *Bulletin* of the Imperial Academy of Sciences of St. Petersburg a short notice of a report presented by Messrs. Lenz and Kupffer, in which the fact is stated for the first time. An officer of the Corps of Pilots at Archangel, has made a long series of observations, and drawn up tables of the results, which have been laid before the Academy, and discussed by the reporters, who affirm his conclusion that a diurnal periodicity in the flux and reflux of the tides in the White Sea is thereby demonstrated. The report and a selection of the tables are to be published; but, we fear, Russian only, and in a Russian periodical.—*London Athenæum, January*, 1864.

Wood is often petrified by carbonate of lime and occasionally whole trunks are changed to stone. The specimens show well the grain of the wood, and some are quite handsome when nicely polished.

The late greenback movement in Nevada Territory has been squelched by the action of the merchants and bankers.

Blanks for Secretaries.—Blanks, suitable for filling out for advertising, furnished gratuitously to advertisers in the Press, upon application to the office.

Ages of Stone and Bronze.—The attempts of the Swiss geologists and archæologists to estimate definitely in years the antiquity of the bronze and stone periods, although as yet confessedly imperfect, deserve notice, and appear to me to be full of promise. The most elaborate calculation is that made by M. Morlot, respecting the delta of the Tiniere, a torrent which flows into the Lake of Geneva near Villeneuve. This small delta, to which the stream is annually making additions, is composed of gravel and sand. Its shape is that of a flattened cone, and its internal structure has of late been laid open to view in a railway cutting 1,000 feet long and 32 feet deep. The regularity of its structure throughout implies that it has been formed very gradually, and by the uniform action of the same causes. Three layers of vegetable soil, each of which must at one time have formed the surface of the cone, were cut through at different depths. The first of these was traced over a surface of 15,000 square feet, having an average thickness of 5 inches, and being about 4 feet below the present surface of the cone. The upper layer belonged to the Roman period, and contained Roman titles and a coin. The second layer, followed over a surface of 25,000 square feet, was six inches thick, and lay at a depth of 10 feet. In it were found fragments of unvarnished pottery and a pair of tweezers in bronze, indicating the bronze epoch. The third layer, followed for 3,500 square feet, was 6 or 7 inches thick, and 19 feet deep. In it were fragments of rude pottery, pieces of charcoal, broken bones, and a human skeleton having a small, round, and very thick skull. M. Morlot, assuming the Roman period to represent an antiquity of from 16 to 18 centuries, assigns to the bronze age a date of between 3,000 and 4,000 years, and to the oldest layer, that of the stone period, an age of from 5,000 to 7,000 years.—*The Geological Evidence of the Antiquity of Man, by Sir Charles Lyell.*

How to Prevent Wet Feet.—A writer in the *Mechanics' Magazine* says : "I have had three pairs of boots for the last six years, and I think I will not require any more for the next six years to come.—The reason is that I treat them in the following manner : I put a pound each of tallow and resin in a pot on the fire ; when melted and mixed, apply it hot with a painter's brush until neither the sole nor upper will soak any more. If it is desired that the boots should immediately take a polish, dissolve an ounce of wax in a teaspoonful of turpentine and lampblack. A day or two after the boots have been treated with the resin and tallow, rub over them this wax and turpentine, but not before the fire. Thus the exterior will have a coat of wax alone and shine like a mirror. Tallow and grease become rancid, and rot the stitching or leather ; but the resin gives it antiseptic quality, which preserves the whole.—Boots or shoes should be so large as to admit of wearing cork soles. Cork is so bad a conductor of heat that with it in the boots the feet are always warm on the coldest stone floor."

Pulverizing and Mixing Iron Ores, Fluxes and Fuel previous to Smelting.—A patent has been granted to Mr. John Thomas, of Batterse, for improvements in treating ores, which consists in pulverizing the matters to be operated on if not already pulverized, and then mixing them with the following ingredients in the proportions named : Sand, or ores reduced to a state of sand, two parts ; clay, two parts ; chalk, one part ; coal, or other fuel, one quarter part. These proportions may, however, be varied according to the quality of the ore, but they must be such that a brick may be formed of the materials used. After they have been well mixed and amalgamated, they are to be formed into blocks or lumps, and then dried and calcined by burning, care being taken during the burning to prevent contact with the air. After calcination the mass is ready for reducing in the manner ordinarily followed in smelting iron ores.

The Mining and Scientific Press.—This work, published weekly in San Francisco, contains a record of all mining transactions in California, and numbers among the contributors to its columns many scientific and practical writers. Brokers and persons interested in mining stocks will find it much to their advantage to become subscribers.—*Victoria Evening Express.*

The crop of maple sugar at the North will this year exceed 25,000,000 pounds, and will go far towards supplying the deficiency caused by the non-production of sugar at the South.

The Mendocino *Democrat* says that the hay crop in Ukiah valley is not as good as our farmers anticipated it would be some time ago. Those that have commenced to harvest their hay say it will not be a half crop.

Legal Tender Notes.

San Francisco, Friday, June 3.....56 per cent.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

Removal.—D. S. Cutter, has moved his Mining Secretary Office to Room 28, Government House, where, in his absence, Brock Johnson will attend to business for him. 23-1m

Record of New Incorporations.

The following is a record of the names of the companies, location of the claims, and the names of the Trustees mentioned in the articles of incorporation, filed in the County Clerk's office, in this city, since our last report:—

Lalla Rookh G., S. & C. M. Co., Arizona Territory; Mrs. F. L. Medbury, Mrs. A. M. Gayetty, Mrs. E. A. Dunbar, Mrs. O. M. Wells, Mrs. S. M. Brooks.

Carbon Coal Co., Contra Costa county; N. C. Fassett, L. A. Booth, A. Walrath, A. P. Brayton, L. Sawyer.

San Luis M. Co., Durango, Mexico; Mark Brumagim, Richard Chenery, Edward Slossen.

Cinco Senores and Veneranda M. Co.; same as above.

Kentucky Copper M. Co., Calaveras county; Bernard Lulofs, C. A. Weike, L. Honigsberger.

NEVADA TERRITORY.

We gather from the Territorial papers the following names of mining companies which have recently filed papers of Incorporation in Nevada Territory:—

Bishop G. & S. M. Co., Sigel district, M. Manseau, Joseph Laflower, M. Brosseau, Aug. Courchaine, F. Valentine.

M. Brosseau G. & S. M. Co., Virginia district; same as above.

Grand Consolidated Pine Wood G. & S. M. Co., Pine Wood district; W. M. Hurst, N. A. Quill, N. Grimes.

Cedar Tree G. & S. M. Co.; S. H. Robinson, Thomas Campbell, W. W. Bishop.

Daney No. 2 G. & S. M. Co., Devil's Gate district; B. Franz, Wm. Mooser, Victor Risson, Jr.

Stuart G. & S. M. Co., New Virginia district; E. J. Chamberlain, J. H. Morrison, S. Cornell, J. K. Stuart, E. C. Ford.

Stafford G. & S. M. Co., Nevada district; A. M. McMillen, H. F. Goodshaw, G. W. Stafford.

Baton Rouge and Henderson Consolidated G. & S. M. Co., Virginia district; D. S. Turner, Warren Heaton, N. W. Winton, T. D. Warnock, C. C. Harvey.

Mary Ellen G. & S. M. Co., Peavine district; A. B. Chubb, B. A. Duval, Joseph H. Dreany.

Sand Spring Pine Road & M. Co., Nye and Churchill counties; J. H. Kinkead, John McCarty, I. G. Bateman.

Hughes Segregated North American Company, Gold Hill district; F. H. Hughes, Robert Apple, W. H. Brewer, Francis Barber, John S. Bates.

Sheba Hurst G. & S. M. Co., Pine Wood district; W. M. Hurst, N. A. Quill, C. C. Green.

PRICE'S CHEMICAL AND ASSAYING CLASS.—The third session of this class will commence on the 20th inst., at his room, No. 5, First street, near corner of Market, in this city. A pupil after going through the course of lessons prescribed for the assay class, will have derived an amount of information which will enable him to ascertain with precision the exact quantity of gold, silver, lead, copper or tin combined in any mineral. The course also embraces practice with the blowpipe, and analysis sufficient to enable him to discover the presence of all the common metals. The course covers three months time, with two evenings in each week. If more convenient to the student, arrangements can be made by which he can work daily, thus lessening the amount of time required for the course, and rendering it possible for the miner from the mountains to avail himself of the advantage of this class in the smallest possible time.

THE CALIFORNIAN is the name of a new literary journal which has made its appearance in this city during the past week, under the direction of C. H. Webb, Esq., a gentleman of considerable newspaper experience and well known literary ability. The *Californian* is made up in sixteen pages, well filled with choice matter.

San Francisco:
Saturday Morning, June 4, 1864.

Another Enlargement.

With the close of the present month terminates Volume VIII. of the MINING AND SCIENTIFIC PRESS. With the commencement of the next Volume, the publishers have determined to permanently enlarge the pages of the sheet from three to four columns, a size but a trifle smaller than that of the London *Mining Journal*, the largest *mining* paper in the world. Our success during the present volume permits us to assure our readers of the permanent improvement and progress in usefulness of our journal.

June 1st, 1864. DEWEY & CO., PUBLISHERS.

MINING SHARE MARKET.

The past has been an unusually quiet week in the Mining Share Market, of this city. There is scarcely a stock that has been exempted from the general decline. Even the leading shares of permanently paying stocks have given way to the pressure, and a universal panic seems to have seized upon the market. A rallying point will doubtless be reached ere many days have passed, but at present no sustaining power is visible, and no effort appears to be making in that direction. The total amount of mining sales at the various stock boards in this city during the past week foot up at 531,758.

Ophir has been more active, but at still declining rates. Our last quotations left it at $1,100; it ruled steadily, on Saturday last, at 950, from which figure it gradually declined to $825 on Thrsuday, but rallied again yesterday to $840, closing at $850. Upwards of fifty feet have changed hands. A change in the management of the company's affairs at Virginia City is reported, and it is said that a more economical policy will be inaugurated.

Gould & Curry has met with more than its usual business at greatly fluctuating rates. Sales were made on Saturday last at from $3,460@3,900; on Wednesday from $2,950@3,500; on Thursday and Friday considerable business was done at more uniform rates, from $2,930@$3,000, closing before last evening's board at $3,050, buyer 30 days. The reports from this mine were never more encouraging than to the present time, and its yield of bullion was never larger. Its regular monthly dividend of $125 per foot was declared yesterday, payable on Monday, a large surplus remaining on hand to the credit of the company.

Savage has met with but a light business at declining rates. After touching $2,000, on Tuesday, it sold on Wednesday at $1,790, dropped to $1,500 yesterday morning, but rallied to $1,850 at the evening board.

North Potosi has been less active at about last week's prices.

Challar has met with less business than last week, and at declining rates. Selling on Saturday last at $625, it gradually declined to $465, Thursday, but subsequently rallied, closing at last evening's board at $514.

Burning Moscow has met with a material decline. It closed on Saturday last firm at $63, after which it gradually dropped to from $42@50 before yesterday's board, closing at $48.

Uncle Sam has declined from $725@700, with slight business.

Lady Bryan has been less active and generally at figures materially below those of last week. The closing figures were $26 cash. and $30 buyer 30.

North American which was held quite firmly on Saturday last at $150, declined to $107 on Thursday, but rallied again yesterday, and closed firm at $126.

Blue Ledge still maintains its recent figures, and remains steady at from $18@20.

Golden Age and Empire still further declined to $25 on Wednesday, but subsequently rallied and closed at $28½. Reports of a very unpleasant character are circulated with regard to the management of this mine.

Adriatic may be quoted at $11@13, a slight decline over last week. Baltimore American is quoted at $35, a fall of ten dollars; Baltic has also declined $10, and is now quoted at $67½; Burnside maintains its last figures, $6; Buckeye has dropped from $11@5½,

Crocket is quoted at $7; El Dorado at $21; Empress at 10; Gov. Downey at $30; Harmon at $20; Kohler Brothers at $15; Libertad at $19: Norton at $3; Nevada, J. G., at $45; Pride of the West at $8; Sheba at $90.

Daney maintains its last figures firmly, and is quoted at $60; Esmeralda has improved a trifle, and is held firm at $5; Hale & Norcross has been heard from at $500.

Imperial is steady at $150; Sacramento & Meredith at $50; and Yellow Jacket at $750.

Sierra Nevada has dropped from $56@40.

Seneca which fluctuated from $15@27½ on Saturday, was held firm at $22 on Monday, subsequently remained quiet until Friday, when it dropped to $12.

Real del Monte has been more freely offered at declining rates, gradually dropping from $47½@35.

Wide West was heard from on Wednesday at $17.

WASHOE STOCK MARKET.

Review of the Week Ending May 31st, 1864.

We have noticed no feature of special interest or importance in the Washoe Stock Market since our last report. The same depression remarked for several weeks past still remains, and stocks continue gradually to recede, with constantly decreasing business. The following comprises the business of the week:—

Jewett & Shepard still continues the only stock which appears to attract much attention in the Washoe market. Even of this only 256 shares have changed hands since our last report, against 550, on the week previous. Prices have also greatly declined, from $26½, to 17½, taking the lowest figures of the two preceding weeks. The average of prices for the week past have been from $20@22.

Seneca has improved from $17¾@$30, the highest figure of the past week, closing at $27½; 70 shares have changed hands.

Knickerbocker has been pretty well sustained, sales having been made from $30 to 34.

Kentucky has dropped from 4½@3¼, with but a single transaction.

Napoleon has dropped from $6¾@5.

Branch Mint, which sold last week at from $33@34, has found but a single purchaser at $26.

We quote Sutro, 53 shares from $1½@2½; Frankell, 16 shares from 1½@2; Rock Island, 35 shares from $16@16½; Lady Bryan No. 2, 25 shares at $1½; Kossuth, 20 at $4@4¼.

We notice single transactions in the following shares, at the prices given:—King Solomon, 10 shares at $1½; Stephenson Kehoe, 15 at $1¾; Union, 10 at $4¾; Arizona, 5 at $4; Randolph, 25 at $7½; Oneoto, 5 at $10; Silver Vale. 5 at 1½; McDermott, 10 at 7½; Grass Valley & Napoleon, 20 at 50 cents; Baton Rouge, 30 at $1¾; Lafayette, G. H., 5 at $5; Colorado, 5 at $2; Baltimore American, 5 at $46; Milton, 2 at $42½.

THAT SACK OF FLOUR.—Gridley and his sack of Sanitary flour have been photographed by Mr. Geo. H. Johnson, of this city, the artist. Two photographs have been taken; one representing this famous sack of flour on a pedestal, surrounded and surmounted with the stars and stripes; the other represents the sack of flour gaily decked with nineteen flags and resting upon Mr. Gridley's shoulders. Both the design and execution are excellent. The pictures are for sale. Orders from a distance may be sent to Stratman.

TERRIBLE ACCIDENT.—A man named M. S. Canahan fell down the shaft of the Jewett claim, near Virginia City, on Wednesday of last week. He fell a distance of eighty feet from a scaffolding, which gave way under him. He built the scaffold himself.

The Portland Oregonian, of the 19th, says that the steamer New World brought down to that place from the Cascades, on the day previous, eight hundred pounds of gold dust.

BUSY.—Business about the lower end of Third street is constantly becoming more and more lively. In addition to the attraction of the Camanche, and the turmoil and bustle centering there in connexion with the San Jose railroad, quite a lively business is constantly in progress at the various shipyards about that locality. The chief object of attraction in that line at the present time, appears to be the new steamer which the California Steam Navigation Co. are now building to run between this city and Stockton. This steamer is just in a condition which begins to show her proportions and manner of build. Persons who may sometimes feel a little ticklish about crossing the Bay during a heavy blow in a steamer of the small class necessary to a successful navigation so high up as Stockton, will do well to take a trip to the South Beach and examine this steamer as she now appears upon the stocks. Such a visit will at once satisfy them that she will prove one of the most staunch steamboats which ever floated upon our inland waters. In addition to ribs of usual dimensions, covered and boarded with suitable planking, she is securely bound from stem to stern by a complete net work of iron bars, in the shape of diagonal braces, which must add vastly to her strength, especially when working in a heavy sea which these steamers are sometimes obliged to encounter in San Pablo Bay.

Another important feature at the south end of Third street, at this time, is the long line of iron pipe distributed through the street, preparatory to being put in the ground to serve as the main pipe for the new gas company, which is now erecting its works under the bluff at the foot of Second street. These works are also progressing finely, so far as the foundations are concerned. Workmen are now engaged in excavating for the gasometer, which will be sunk to about the level of low water mark.

THE CAMANCHE.—The plates and machinery of the Camanche have been pretty thoroughly overhauled, cleaned and painted, where necessary. Every part and portion has been placed in position about the yard, so as to be convenient for handling, when the contractors are ready to commence the process of putting her together. Her two huge guns have been elevated to a conspicuous position, where they will show to the best advantage, for the benefit of the various saloons in the neighborhood and the Omnibus Railroad Co. The yard is daily thronged by visitors. Few strangers come to the city without taking a trip to see the Camanche. We have not yet seen any signs of preparation for putting this iron clad upon the stocks. Who is responsible for the delay? The people, for whose protection, and at whose expense the work has thus far progressed, are anxious to see it completed. We have heard that contractors, both for building and wrecking, have thus far made money; but that the next movement must be done at a loss, and that is what's the matter.

MAP OF THE COLORADO RIVER MINES IN ARIZONA.—Mr. Geo. W. Gildersleeve has exhibited to us a fine looking map of the above rich mining section, compiled by I. M. Blood, Esq., from notes and surveys made by Henry Ehrenberg. It shows the principal towns, settlements and mining districts and location of claims. Among others of good repute, we notice the fifteen lodes now being prospected by the Henry & Barnard Consolidated Co., in Weaver district. The map affords a minute view of what must soon prove a wonderful field of precious minerals. Parties interested in Castle Dome, Eureka, Weaver, La Paz or Chimewawa, can see the illustration of their district at No. 302 Montgomery street, room 5, third floor. It should be published.

THE AQUILA is now pretty well righted up, and resting on the flats a short distance from where she was sunk. After her hold has been thoroughly explored for any remaining pieces of her late cargo, she will probably be sold and broken up.

"FORMATION OF METALLIC VEINS."

With the present issue is concluded the valuable and interesting series of articles which we have been publishing under the above head. The principles by which the accumulation of ore in lodes or metalliferous veins is regulated are so enveloped in mystery that the prosecution of mining enterprises is almost as much a matter of chance, at the present day, as it was to the miner who delved three or four centuries ago. The different theories and their modifications are almost as numerous as have been the observers. Nor is this to be regarded as any especial wonder when we reflect upon the numerous difficulties with which the subject is surrounded. The slowness of the operations requires any one set of observations to extend over a period of many years. Then such a variety of conditions occur, and such a combination of problems—geological, physical and chemical are presented for solution, and at such distant periods of time, that even the most thoughtful and practical observer is compelled to regard them only in the light of partial experience, and to exercise an uncommon degree of natural shrewdness in order to arrive at results. In addition to all, the scientific observer, when he attempts to talk about these things with practical miners, and especially if, in the progress of his investigations, he presumes to advocate the necessity of an accurate knowledge of this science, is too often met with a spirit of indifference or even ridicule. In the absence of these, he not unfrequently encounters a species of traditionary lore, founded upon a false basis or no basis at all, against which he finds it almost impossible to make headway. Much valuable knowledge, it is true, has been collected by intelligent mining agents and captains; but, from the lack of system in observing and recording phenomena, very little has been so collected from this source as to be of any special service to mankind. The most of such information is mainly traditionary, and the experience so gained perishes with the men, and society is no richer for their acquisition.

In no country are so many opportunities presented for adding to this useful branch of science as in California, and in no other do we find so large a proportion of skilled and observing minds engaged in the practical operations of mining. The low condition of our State and National finances are, at present, a great bar to that thorough and systematic class of observation which is so desirable; yet much has already been accomplished by the able corps connected with our State Geological Survey, the proofs of which will soon be submitted to the public through the volumes now about to be issued.

In addition to this class of governmental observers, we have a large number of private individuals who, without money and without price, are constantly engaged in accumulating facts and data, the collection of which, at some future day, will add vastly to the store of knowledge already obtained in this direction. Among those gentlemen we may place our able correspondent, Mr. E. A. Miles, who is a close observer and shrewd and original thinker. The papers which he has given the public are of much value, and exhibit a marked degree of originality. The theory which he adopts is one which is rapidly gaining ground, and, should future observations fully substantiate it, we may look forward with much confidence to the time when we may be able to calculate with an almost unerring degree of certainty, as to the direction or depth in a lode where we may expect to find remunerative ores. For the further benefits to be derived from this class of observations, we would refer our readers to the brief "summing up" which our correspondent gives at the close of his communication to-day.

Copper in Vermont.—Several new and valuable copper mines have been discovered in eastern Vermont, one of the most promising of which is near Norwich.

CALIFORNIA.

Nevada County.—According to the *Gazette*, mines in Nevada county are doing very well. Instances are given of hydraulic claims that turn out sums ranging from $300 to $1,000 per day, each.—The *Transcript* says that some of the richest claims in the county are being opened at Brandy Flat, by Knowlton and Mallman. The gold is found in a conglomerate of gravel and cement.

Butte County.—The Marysville *Appeal* has received a letter from Honcut City, which says:—"We have all got our fortunes in the Rattlesnake. To-day we struck the ledge, which is about eighteen inches wide, and the richest I have ever seen. It is completely spotted with gold, and not confined to one portion of the rock, but all through it. I honestly believe it will crush $1,000 to the ton."

New gold diggings have been discovered in a flat near Oroville, which, at the depth of twenty feet, pay twenty-five cents to the pan. The *Union Record* says that the announcement of this fact created great excitement among the miners and citizens of Oroville. Everybody rushed to the new diggings, and merchants, miners, lawyers, doctors, county officers and printers, have all staked off claims, and consider themselves rich in golden fact. Some three hundred claims have already been taken up, and over one hundred shafts are going down, and still a grand rush continues to pour in from all quarters.

Colusi County.—A gentleman writing from Colusi county, speaks very highly of the mines in the western portion of that county, particularly the Pacific claim, which has recently revealed a vein of great apparent value. The Company has already taken out a number of tons of ore for shipment. The Queen, Eagle, and Union are also highly spoken of as well as the Copper Hill and North Star. On the Consolidated Eagle, the tunnel has been run in 160 feet. It has been all the way through rock—some of it very hard. They expect to strike the lode in about 100 feet more. There are several other companies at work with a fair prospect of success.

The Cosumnes Mining Co., according to the Sacramento *Union*, are sending to Sacramento from five to ten tons of copper ore daily. The ore is forwarded thence to this city by steamer.

WASHOE.

New Mining District.—A new mining district has recently been discovered between Humboldt and Reese River, and named Pine Wood. Some rock from this district has lately been assayed by Kellogg & Hewston of this city, which reached the high figure of $2,218 in silver. It is said to be a peculiarity of this rock that it is entirely free from gold. It very much resembles the Sheba rock; the silver occurs as green and blue chlorides. A number of companies have recently been organized in Virginia City to work mines in the Pine Wood district, and arrangements have been made for the shipment of a quantity of ore to that place for working and giving it a fair prospect.

The Potosi.—The *Daily Message*, published at Gold Hill, says it is estimated that the Potosi claim yielded $100,000 during the month of May. The company have ore enough available to supply twenty large mills. The Mexican mill, at Empire City, has a large amount of it to crush, and guarantee sixty-five per cent. of its assay value.

The Gentle Annie Company keeps steadily at work at its shaft, just beyond the North American claim. It has already sunk the shaft which it commenced a few weeks ago, to the depth of seventy feet.

The Tremont, in Flowery district, has struck some excellent rock within the past week, whereat the proprietors are very much excited.

Gould & Curry Improvements.—The Gould & Curry Company are about to change the process of reduction in their mill from the dry to the wet method. The dry mode is very hard on the lungs of the workmen and is no more economical than the wet plan. They are now engaged in the erection of six large patio platforms, to be used in working the tailings from the mill. The amalgamation will be effected in the patios without the aid of the wooden wheels commonly used, a number of Mexican mustangs having been procured to be used in treading the pulp. This plan of working silver ore is practiced in Mexico, but is very hard on the poor animals, as, owing to the chemicals used in the pulp, their legs are liable to become very sore, and the mercury in the mass is also injurious to their health.

Drain Shaft.—A gigantic enterprise, according to the daily *Message*, has been started to sink a shaft for drainage purposes, in Gold Hill proper. A company has been formed whose intention it is to sink a large tripple shaft, about the middle of the Gold Hill mines now opened, and to sink at least six hundred feet before stopping, and into which all the water of the hill will be drained. Two powerful engines will be ordered, each to run two large twelve-inch pumps. All the companies, but two, owning in the hill have signed the necessary documents in support of the measure, and those will, doubtless, enter into the arrangement the present week. As it now is, each company has to pump or raise its own water, and if a few feet lower than its neighbors, would necessarily drain their water. A general system of drainage, as is now contemplated, has been much needed, and will prove of very great advantage to all.

The La Plato Oro is now working a in shaft and tunnel. The former has been sunk 100 feet below the level of the latter, which is being cleared out, repaired, retimbered, and will in a short time be run further ahead.

The New Oregon Company keeps work going ahead in its shaft which is now 115 feet deep, and about sixty-four feet from the tunnel which runs under it. The company is having a very fine shaft sunk, and seem to be taking the lead of its neighbors in making improvements.

The Branch Mint, located on the north side of Crown Point Ravine, having run an incline from a low portion of the ravine to a depth of about one hundred feet to test the character of their ledge, and finding it of a character to warrant any reasonable outlay for its development and impracticable to work by means of that incline, in consequence of the influx of water, they immediately set to work to sink a double shaft. This shaft has been sunk to the depth of 220 feet, and as low as the water level in the incline, the men have commenced to drift for the ledge, which will probably be reached in the course of a few days. The Branch Mint is probably on the same ledge as the Hawkeye, Uncle Sam, Sweezy and that tier of claims, and if one is valuable there is no reason why the others should not be so too.

Plumas Copper and Silver Mines.

Quincy, May 30th, 1864.

Editors Press:—Returning from a trip to Honey Lake Valley, I called at the copper mines in Light's Cañon, and spent two days among the different mines. The Superior mine is opening very fair; it is destined to be one of the very best mines in the State, though the Eclipse ledge is undoubtedly the great parent vein of that district, and will in a very short time eclipse all other veins in that section.—They are going ahead with their work with a spirit truly commendable. There are the Superior, Summit, Northern and Southern Superior, Eclipse, Lincoln, Mammoth, and four or five others, that are worked with energy, which probably will be shipping ore within a few months. The Superior has about $5,000 of first class shipping ore on hand, besides having wasted more than one-half that amount in the last three months time. The mine can be greatly improved, I think, by different management.

The other ledges, it is understood, are to be worked in a different manner, but let that be as it may, that section of our State is bound to speak for itself in a very short time, for there never has been as good copper mines discovered in the United States before.

I am now spending a few days in the Argentine district, near American Valley, Plumas county, and I find that the Howard Silver Co. have struck it very rich in their tunnel. They are about 200 feet below the surface, and have gone into the vein ten feet, finding the rock completely mixed with sulphurets of silver. I have just made an assay of one pound of the rock, and I find it pays at the rate of $408 per ton, of 2,000 lbs. It was no picked rock, but a fair average of the rock for the ten feet in the vein.—They are still at work cutting the vein to find how thick it is; then they intend to call a meeting to take measures to put a mill on the ledge, and I think I am safe in saying that they undoubtedly have a good and rich silver ledge. Yours, L.

Manufacture of Steel Directly from Pig-iron.—Messrs. Brant and McElroy, of Pittsburg, Pennsylvania, have recently patented a process for manufacturing steel directly from pig-iron in an ordinary puddling furnace. Pulverised charcoal, or other carbon, is thrown into the furnace when the iron begins to granulate, and the furnace is closed up so as to retain the gases evolved in it.

The manufacture of hoys' hoops has become an active trade in Connecticut. The price is from $3 to $5 per hundred.

Mechanical Department.

[Written for the Mining and Scientific Press.]

HOME INDUSTRY.

GOLDEN STATE FOUNDRY.

This foundry is another of the old pioneer establishments, being commenced in 1850 by Mr. George K. Gluyas. The firm was known for a long time as Palmer, Hanscom & Co., but recently it has changed to Palmer, Knox & Co. Mr. Knox is extensively known to our community as the patentee of Knox's amalgamator. The establishment is not so large as some of those already spoken of; nevertheless it is important, both in capacity and extent. It employs between 50 and 60 hands regularly, and consumes, on an average, about 140,000 lbs. of iron for casting, and 10,000 lbs. of wrought iron, a month; melting coal, 12 tons; steam coal, 12 tons; forge coal, 2 tons a month; lumber for flasks, patterns and machinery frames, 5,000 feet a month. They make no boilers at this establishment. Their largest casting was three tons, but they have a capacity for six, which is now being increased, to meet the demands of the times, to ten tons. Of course they manufacture all kinds of machinery. The balance valve cylinder, at present in use at the Gould & Curry mine, issued from this foundry, being the first one of the kind manufactured in California. The peculiar merit of this cylinder is its economy, making, I understand, a saving in power of 20 per cent., which, in Washoe, is equivalent to $32 per day. The Tyler water wheel, an Eastern invention, extensively used throughout the old States, and though only recently introduced here, is being steadily adopted amongst ourselves, is alone manufactured at the Golden State Foundry. This wheel is spoken of as combining durability with cheapness, and simplicity of design with great economy in power.

To keep progress with the times, the firm this week introduce, for the first time in California, the McKenzie Blower, which, in the expensive item of coal, is calculated to save at least 50 per cent. The revolutions will be from 100 to 150 per minute. We regret it was not completed in time for us to see it operate. We shall, therefore, postpone a thorough description of this new and important application of power in our midst. The firm are now manufacturing a large size stone-breaker, of Blake's patent. This useful machine is already extensively in use in the mines and public works. Its ordinary capacity of crushing is 100 tons in 10 hours, reducing the rock or stone into cubes of one inch and a-half, with 3-horse power. The new machine in course of construction will admit into the jaws a rock 15 inches by 9, reducing it to the same size as the old one. It will make 200 strokes a minute, and requires 10-horse power. We cannot at present fully estimate the utility of this machine at our quartz and copper mines. It was illustrated in our issue of 16th January last, and we would here again call the particular attention of our readers in the mines to its merits. Another interesting and ingenious article at present to be seen here is Dunbar's Piston Packing Ring. This is intended to supersede the old style of packing ring with bolts, which are always rusting and getting out of order. These never do either, besides possessing many other striking advantages. All the iron work of Messrs. Hunt's celebrated windwills (of which we shall speak more fully when we reach their establishment on Second street, is prepared at this foundry. At present, as this purely California invention and manufacture will be illustrated by us next week, we shall only say that it is generally adopted throughout the State, and gives complete satisfaction. One of these mills at the Catholic Asylum in this city raises water 272 feet perpendicularly, and throws it horizontaliy 4,220 feet.

We had also the pleasure of inspecting one of Pond's iron quartz mills. The evil of the old style of iron quartz mills lay in the bed or mortar being connected with the outside columns, from which arrangement the jar of the stamps crystallized and weakened the iron in the columns. Pond's mill, by disconnecting the bed and outside columns, avoids this imperfection and its attendant expense, and is so far deserving of patronage, for it is certainly a great improvement. Randall's amalgamator, together with Mr. Knox's, have had the run here; a large number of both, together some 150, having been made during the past year. Mr. Knox's pan, we believe, is the oldest in the State. The last article we shall mention is, perhaps, the most ingenious of all, and to our agricultural friends, especially, interesting. It is a small-sized iron churn, which produces butter invariably in *five minutes*. From an examination of the machine, which is simple, ingenious and evidently effective, we believe the statement made to us of its power. The patentee's name we did not learn, nor shall we give now a more elaborated account of its mechanism, as it will shortly be illustrated in our pages. In the meantime, we beg the dairy people, and the curious in mechanics, to give it an inspection. The pattern room and general machinery of the Golden State Foundry are as complete, though not so extensive, as those of their more pretentious rivals, and there, as well as at the works already mentioned, the scholar or mechanic, in pursuing his investigations, will always receive a courteous and hearty welcome.

THE CALIFORNIA FOUNDRY.

This establishment is situated on Fremont street, near Market. It is of recent origin, being commenced in April, 1861, by Messrs. Young & Brodie, but the firm is now known as Brodie & Co. Their business is confined especially to house and ornamental casting, of which class of work they do the heaviest in the State. The iron work of nearly all the recent structures in this city, so creditable to us as a people, issued from this foundry. We might instance the McCreary buildings on Montgomery and Pine streets, and Maguire's splendid new theater adjoining. The work; however, most creditable to the firm and the State, are the Corinthian pillars and arch forming the portico of Donohoe's new bank on Montgomery street, now rapidly approaching completion. These four pillars are each fourteen and a-half feet high, and one foot four inches in diameter. The arch surmounting them weighs four tons—the largest of the kind so far made in the State. The entire work is admitted to be chaste and elegant, bearing the strongest testimony to the growth of mechanical art amongst us. This firm employs 25 hands. Their largest casting is the arch already spoken of—almost the full capacity of their cupola—which, to meet the growing demands of their business, is to be immediately enlarged. They consume about 104,000 lbs. of iron a month, with 20 tons of coal and a proportionate amount of lumber. This firm is composed of enterprising men, mechanics by education and profession, who owe their respectable position to their industry. A few years, no doubt, will show us the California Foundry, if conducted with the same energy and enterprise as heretofore, as one of the leading casting establishments in the State, and a proud evidence in itself of its wondrous mechanical growth. L. H.

[To be continued in our next.]

IMPROVEMENT IN STAMP LIFTERS.—Mr. Hodge, of Detroit, Michigan, has introduced what appears to be a decided improvement in the manner of lifting stamps. By this invention, the heads, instead of being always lifted to a constant hight, are lifted to hights variable with the accumulation of ore in the mortar. For instance, if a stamp, when standing upon the bottom of the mortar, is lifted a distance of six inches, and before being allowed to fall a block of four inches thickness is placed beneath it; the next revolution of the cam shaft will raise that stamp to a distance of ten inches; and thus the stamp will constantly have the same fall upon the quartz to be acted upon, whether the accumulation in the mortar be more or less. The device for accomplishing this is very simple. We shall give an illustration of it, by which the same shall be made perfectly plain to every reader.

SUBMARINE CABLES.—It is stated that the Varna and Balaklava cable worked at the rate of five words per minute; the Red Sea submarine line is worked up to seven words, and the Malta and Alexandria to ten. The speed of the old Atlantic cable was only two and a half words. The greatest speed attained on long submarine lines is by the use of the Hughes instrument; next to this comes the Morse instrument. Improvements are so constantly made in this department of scientific research, that the year yet to elapse before England and America possess a common pulse under the sea may solve some problems yet unriddled.

NEW BURGLAR-PROOF VAULT.—A burglar-proof vault has been invented, in which a space between two of the plates is filled with iron balls about one inch in diameter, entirely loose. The plates cannot be drilled through, as a drill must strike one of these balls, which would rotate with the tool instead of being perforated by the process. One of these vaults has recently been erected in the Custom-house in Chicago.

LIGHTING GAS BY ELECTRICITY.—At the monthly stated meeting of the Franklin Institute, held February 18, 1864, Messrs. Cornelius & Baker exhibited a very beautiful method of *lighting gas* by means of frictional *electricity*, arranged for use with a bracket, two portable lighters, and a table light, all being simple in arrangement and readily kept in order.

These instruments are constructed upon the principle of the electrophorus.

The electric *bracket* is arranged with a brass cup in the form of a vase, resting upon the bracket, with a connecting piece of hard rubber. This cup is lined with lamb skin covered with silk, and contains the hard rubber electric piece which corresponds in form to the inside of the cup. A coiled covered wire connects the brass cup, with a wire attached, to the burner, and terminating just above the burner.

In order to light the gas, the stop is turned, the hard rubber piece lifted partly from the cup, thus liberating the spark and lighting the gas.

The *Portable Lighter* consists of the same vase or cup, with the addition of a non-conducting handle.

When the brass cup is lifted from the electric piece and held to the conducting wire of the burner, the gas is immediately lighted.

Another portable instrument called *Double Air-Tight Electrophorus*, consists of two metallic tubes, each closed at one end, and connected together at the other, with a non-conducting ring of hard rubber, the inside being lined with lamb skin. A hard rubber rod is placed within them, the length of one of the tubes, and fitting them so as to move somewhat freely from end to end, and the tube is raised to the connecting wire of the burner, this piece changes its place again, falling into the tube held by the hand. The spark leaves the upper end of the tube at the same time and lights the gas.

The *Table Light Burner* consists of the same instrument arranged upon a pivot regularly attached to the pillar light.

CRYSTALLIZED IRON.—Crystallized Iron, or "Franklinite," is the production of the mine of the New Jersey Zinc Company. There is but one mine of this ore in the world. The zinc being first extracted from the ore, the residue is the brilliant and singular metal which we have named "crystallized iron." For many years, no use was made of this metal, and it was simply kept in small specimens in gentlemen's cabinets as a curiosity. However, a use has at last been found for it, and, since it has proved so superior in this instance, many other avenues for its introduction are now opening; and it bids fair to prove not only one of the most remarkable, but one of the most useful and valuable metals the world has ever known. As a preventive against drilling, when combined with wrought iron and steel, it is the only real protection against a burglar now in use. Chilled iron, by late improvements in hardening drills, can be easily bored. Hardened steel is not only so brittle as to be almost useless, but its temper can be drawn by a blow-pipe, and then it is at the mercy of the burglar's tools. With "the crystallized," the case is different; it can be furnished any thickness, is not so brittle as any other hard metal, can not be affected by a blow-pipe, and is the hardest material to bore through ever yet produced. It is from this description of iron that Herring's celebrated burglar and fire proof sales are manufactured.—*Am. Mining Gazette.*

PATENTED COMBINATION.—Where a patent is for a combination, a person who takes a new and material part of the combination, but does not apply it to a similar purpose to that for which it was applied in the patented combination, does not infringe the patent. This was the holding of the Court of Common Pleas in the case of Lister *vs.* Eastwood, an English decision, equally applicable, however, to the American Patent Law.

A NEW QUARTZ BATTERY—The Marysville *Appeal* speaks of a new quartz mill or battery invented by Dr. A. Bronson, of that city, which is thought to contain important improvements. It is constructed on the rotary principle—the stamps standing in a circle. The *Appeal* says it must be seen to be appreciated.

IRON CEMENT.—To make an iron cement suitable for making rust joints, mix thoroughly 112 lbs. of clean cast-iron borings or turnings, with 8 ounces of sal-ammoniac and 1 ounce of flour of sulphur, and add sufficient water. Keep wet when not to be immediately used, or it will heat and be spoiled.

IT has been calculated that twenty cents worth of coal applied to the steam engine, will raise 56,000,000 pounds one foot high; the same coal applied to horse power, only 3,600,000 pounds; to electro magnetism 900,000 pounds; and to manual only 600,000 pounds.

GENIUS AND TALENT.

Genius is a certain principle in the human mind which soars and sings without any apparent effort.—Talent is a faculty which requires effort to accomplish results. The one ascends heavenward on the wings of imagination, and revels in all the bright romance of ideality. The other gathers itself up to do battle with realities, and puts forth useful effort. Genius is a strange, inborn, mystic power, of which its very possessor knows but little or nothing. Talent is almost always the result of careful training.—Genius works brilliant mental conceptions, which please the fancy and dazzle the world. Talent is an uplifted hammer, whose telling blows unlock the secrets of nature, science and art. Genius will paint a picture, carve a statue or write a poem. Talent will triangulate the universe, draw lightning from the skies, and enchain a listening senate with bursts of eloquence which carry conviction with every sentence. Canova, Reubens and Byron were born of genius, and could never have been anything but what they were. Newton, Franklin and Webster were men of talent, and owed all they were to laborious and unceasing effort.

The results brought about by men of genius come almost unasked—they are intuitive. The conceptions of Byron scarce cost him an effort beyond the mere mechanical labor of putting his thoughts upon paper.

Mr. Webster was once pressed by a gentleman to speak upon a subject of great importance. He declined on the ground that he had no time in which to prepare himself. "But," said his friend, "a few words from you would do much to awaken public attention." "If," replied Mr. Webster, "there is so much weight in my words as you represent, it is because I do not allow myself to speak on any subject until my mind is imbued with it by careful study and examination."

Alexander Hamilton once said to an intimate friend: "Men give me some credit for genius. All the genius I have lies in this: when I have a subject in hand I study it profoundly. Day and night it is before me; I expose it in all its bearings; my mind becomes pervaded with it. Then the effort which I make the people are pleased to call the fruit of genius. It is the fruit of *labor* and *thought*."

Webster and Hamilton were men of talent. People have sometimes attributed their great efforts to genius. "Labor and thought," which superinduced talent, was the lever with which they wrought out their greatness. But few are born to genius; while multitudes are born with faculties which, if rightly directed, will lead to honor and to fame.

Industry and perseverance, in most men, whether in mechanical, mercantile or professional pursuits, is all that is needed to give talent and success. Every lawyer may not become a Webster, nor every mechanic a Stephenson. Neither can every painter become a Reuhens, or every poet a Byron. There are but few, however, in any walk in life, who, with proper exertion, will fail to arrive at an honorable degree of excellence and usefulness.

El Dorado Canon.—Hon. William H. Sears, late Speaker of the Assembly, has recently returned from a trip to El Dorado Cañon, near the head of navigation on the Colorado river. He brings most satisfactory reports in relation to the richness and extent of the mines in that region. He thinks fortune is yet in store for holders of feet in that section.

Patriotic Movement.—The New York *Express* says an effort will he made in that city to organize a society to encourage the use of domestic goods, or prevent the exportation of so much gold for the payment of the luxuries of dress.

Discovery in Horticulture—The Ohio Farmer says that coal oil has been found, by accident, to be a most effective means of protecting fruit trees against the ravages of the curculio, by placing sawdust, saturated with the oil, at the foot of the tree.

Australian Mammals.—A distinctive feature in the greater number of the Australian mammalia, it is observed, is found in the fact that the female is so often found provided with a pouch or bag in which to carry her young. "This anomalous organization," says a recent writer, "seems to have prevailed almost to the exclusion of any other, and to have been so persistent and universal, that in all the *fossil* mammalia discovered in Australia the same type is found; and as in England and other parts of the world the remains of extinct species of animals, often of gigantic proportions, are found entombed in the soil on which they once lived, so in Australia we find in the newer tertiary deposits the bones of extinct animals of colossal proportions. One of these, named the *Diprotodon* by Prof. Owen, by whom it has been described, must have been as large as the elephant. It has, however, the peculiarity common to other known Australian mammals of being a marsupial."

The fossil remains of animals of the same organic type are also found in England, but only in the oldest of the fossiliferous rocks, from which it would appear that these early species preceded and ushered in the higher forms of mamalia, which remain to the present day. The marsupials of England have long since perished. They have probably existed in other countries, where their fossil remains have not yet been noticed, and where they have become extinct, giving place to mammalia of a high order as in England. A curious and almost unavoidable inference seems to follow; that as no similar progression has been noticed in Australia, we must look upon that continent as of much newer elevation than the four greater ones. It has not yet had time, in its millions of years of existence, to fully develop its animal progress. This idea also looks to the establishment of the recent theory of a variety of centers of creation.

The Book of Nature is being gradually unfolded. Her history is written in indelible characters upon the enduring rocks. The researches of man during the present century, have undoubtedly discovered the key that will ere long serve to decypher and translate the mystic characters, which will tell us all of creation that is permitted for man to know this side of eternity. He who fears to look boldly into the teachings of science, or follow nature up to nature's God, exhibits a lack of true confidence in the faith that is within him, and would trammel with human bonds that infinite portion of his existence which the Creator doubtless conceived when he resolved to make man in his own image.

Valuable Copper Mines.—The copper mine known as the Great Devon Consols, located in Devonshire, England, is one of the most valuable mines in the British empire. Since it was first opened—at a comparatively recent date—its gross yield has been not less than $10,000,000. About one half of this amount has been paid out in dividends and lord's dues. The mine is now in the hight of its prosperity, and its annual net yield is set down at about $275,000, about $50,000 of which goes to the Duke of Bedford, as lord's dues. The copper mines of Devonshire are all found in slate, not one having hitherto been found in granite. The ore which predominates is the yellow sulphuret, which, when roasted, brings an average price of about $25 per ton.

The Burra Burra copper mine, in Australia, is also one of great value, though not as yet fully developed. When first opened, this mine for a while paid back to its stockholders the entire amount of its paid up capital, every six weeks.

A development was made in Cincinnatti lately concerning Catawba brandy. Responsible vintners, declared that the pure article would cost from $5 to $8 a gallon, adding that there was no genuine article of the kind in the market; the quality generally sold consisted of pomace, whisky and fusel oil.

Ballooning in the army has been voted a failure, and all the aerial apparatus belonging to the Government has been sold at auction.

Testing Oils by their Cohesive Figures.—Chemistry having failed to detect some admixtures of oils, C. Tomlinson has had recourse to a physical test, doubtless suggested by the researches of Savart, which he described before the London Pharmaceutical meeting of last month. The test depended upon the forces of cohesion, adhesion and diffusion. A drop of the liquid to be tested was carefully dropped upon chemically pure water in a chemically clean vessel. The force of adhesion endeavored to spread the oil in a thin film over the surface of the water, the force of cohesion endeavored to prevent this, and from the contest of these two forces there resulted figures which the author believed to differ in the case of every independent liquid. There might be instances of two or more liquids differing in chemical composition, but having the same physical properties, where the figures would be identical. Such cases, however, must be rare. The oil must be dropped from a rod that has been made perfectly clean by being washed with strong sulphuric acid, rinsed in water, then washed with caustic potash and again rinsed with water. The rod should be held only about one tenth of an inch from the water when the oil is dropped. The figure produced by castor oil is of great beauty. As soon as this oil is dropped it spreads out in a series of rings, magnificently iridescent. Outside there is a silver corona, which breaks up into a delicate, lace-like pattern; this appearance lasts for some seconds. The figures of the fixed oils are more durable. Mixtures could be easily detected as the figures produced partook of the characters of both the constituent oils, yet resembling the proper figure of the oil which is in excess. A mixture of lard oil is best shown in what may be called the residual phenomena, the lacelike patterns being scattered over with numerous small blotches. Croton oil gives a magnificent figure of large pattern, and a mixture of five per cent. of this oil with castor oil may be readily detected by the practiced eye. Turpentine gives a remarkable figure; the film flushes out immediately almost to the edge of the vessel; the outer circumference is dotted with numerous small bosses, which are larger within, and enclose patches of irisdescent colors. The figure produced by balsam copaiba was a magnificent sight. A succession of rings were thrown out, showing beautiful colors and a metallic luster. A mixture of balsam and castor oil gives neither colors nor pattern.

Our Sources of Wealth.—Happily for us, this crisis in our national career came upon us, providentially, in the midst of a progressive development of material wealth, such as no people could have hoped to enjoy. Blessed with the natural resources of a continent extending through the temperate and into the torrid zone, and fronting on the two great oceans of the globe; having an active population, well skilled in all the industrial pursuits distinguishing modern civilization; receiving constant accessions of enterprising people from Europe; the agricultural and mineral wealth of the country, yielding easily their vast stores to the willing hands of honest labor, it was only requisite that with firm reliance upon the favor of heaven, we should possess that unflagging patriotism which could brave all dangers and suffering in defense of our cherished nationality. A million and more of brave men have volunteered to prove with their life-blood that we do possess this patriotism. But no amount of resources, however enormous, can be made available for the support of a nation's existence, if waste and extravagance and incompetency be permitted to direct the affairs of state; for a public man, without skill in his department, robs the people, and commits treason to the nation, as effectually as if he were in the ranks of the enemy, by occupying a position in which ignorance of duty becomes a crime against the life of his country.—*Exchange.*

Rice.—Rice was introduced into South Carolina by mere accident. In 1696 the master of a vessel from Madagascar landed about half a bushel of an excellent kind, from which small beginning sprung up an immense source of wealth, both to the agriculturalists and merchants of the Southern States. Within little more than half a century from that time 120,000 barrels of rice were exported in one year from South Carolina, and 18,000 from Georgia, all from the remnant of a sea store left in the bottom of a sack.

"If you go into a totally dark room, where there happens to be a pure white object, you will, after a time, know in what part of the room it is; and, if you have patience, you will soon be able to distinguish it from the articles. Again, if you are in the dark, and an object of light color is near you, however minute, it will in a few moments become visible. You yourself are in darkness, yet you see. The object of your vision sheds no light on other bodies however near. It is merely self-illuminating.

Delinquent Sales.

Prima Donna Gold and Silver Mining Company, Devil's Gate District, Nevada Territory.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment (No. 6) levied on the second day of April, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

20-5t Office, No. 321 Front Street, San Francisco.

Coughs and Colds.—The sudden changes of our climate are sources of PULMONARY, BRONCHIAL and ASTHMATIC AFFECTIONS. Experience having proved that simple remedies often act speedily when taken in the early stages of the disease, recourse should at once be had to *"Brown's Bronchial Troches,"* or lozengers, let the Cold, Cough, or Irritation of the Throat be ever so slight, as by this precaution a more serious attack may be effectually warded off. PUBLIC SPEAKERS and SINGERS will find them effectual for clearing and strengthening the voice. Soldiers should have them, as they can be carried in the pocket and taken as occasion requires.

Agents for California, Redington & Co., San Francisco. 23-1m

San Lorenzo Gold and Silver Mining Company, Santa Cruz County, Cal.

On the 1st of June. For terms apply at the Laboratory, on the evenings of Tuesday and Saturday, at 7 o'clock; or at the office of the "Pacific Mineral Company," Odd Fellow's Hall, Montgomery street. THOMAS PRICE.
San Francisco, May 10th, 1864. 20

The Annual Meeting of the Stockholders of the Pioneer Coso Gold and Silver Mining Company, Coso District, for the election of Trustees and the transaction of other business, will be held on WEDNESDAY, the 6th day of July, 1864, at 3 o'clock P. M., at the office of the Secretary, No. 305 Montgomery street, San Francisco. A punctual attendance is requested.

J. S. LUTY, Secretary.

San Francisco, June 2, 1864. 23-4t

Wyandotte Mining Company, Amador District, N. T.

The first ANNUAL MEETING of the Stockholders of the Wyandotte Mining Company, for the election of Trustees, will be held at the office of the company, No. 620, Washington street, on Tuesday, June 28th, 1864, at 7½ P. M.

23-4t W. AUGS. KNAPP, Secretary.

Coso Silver Mining Company, Coso District, Tulare county, California.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 2d day of June, 1864, an Assessment of one dollar per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold or Silver Coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of sale. By order of the Board of Trustees.

D. W. CHAMBERS, Secretary.

23-4t Office, No. 636 Clay street, San Francisco.

Henry and Barnard Consolidated Gold, Silver and Copper Mining Company, Arizona Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 2nd day of June, 1864, an Assessment of Twenty (20) cents per share was levied upon the Capital Stock of said Company, payable on the 3d day of June, 1864, in United States Gold Coin, to the Secretary, at his office.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2nd day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of July, 1861, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale.

On all Certificates of Stock advertised for sale as delinquent, the holders will be charged by the share to pay expenses.

A discount of three per cent. will be deducted on all assessments paid on or before the 11th day of June. By order of the Board of Trustees. I. M. BLOOD, President.

GEO. W. GILDERSLEEVE, Secretary. (23-4t)

Office, 302 Montgomery St., third floor, room 5, San Francisco.

Astor Ledge and Company, Big Creek District, Lander county, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of May, 1864, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately to the Secretary, at No. 3, Armory Hall, 3d floor, corner of Montgomery and Sacramento streets.

Any stock upon which said assessments shall remain unpaid on the 11th day of June, 1864, will be advertised on that day as delinquent and unless payment shall be made before, will be sold on the 29th day of June, 1864, to pay the delinquent assessments, together with costs of advertising and expenses of the sale.

S. PURDY, Secretary.

Office, Armory Hall, Montgomery and Sacramento sts. 20-4t

Baltimore Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held May 30th, 1864, an assessment (No. 2) of seventy-five cents per share was duly levied, payable in U. S. coin, to J. Warren Clark, Secretary, 430 Montgomery street, San Francisco, or to H. J. Hawkins, Treasurer, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 15th day of July, 1861, at the office of the Company, at 2 o'clock P. M., to pay the delinquent assessments and cost of advertising and expenses of sale. By order of the Board of Trustees.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, Room No. 5, 3d floor, San Francisco. 22-2t

Engineer.

A situation is wanted by a competent Engineer, who is prepared to pay particular attention to all kinds of work connected with civil mining and constructing Engineering. Companies requiring a practical Engineer, Surveyor or Draughtsman will do well to communicate.

Address "Engineer," Office of the Mining and Scientific Press, San Francisco. 22-tf

DUNBAR'S
Patent Self-Adjusting Piston Packing.

Requires no Springs or Screws.—Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST IN friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this Valuable Improvement, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

OTIS V. SAWYER,
NOTARY PUBLIC,
And Commissioner for Nevada Territory.

Office, 608 Montgomery street, San Francisco.

Having resigned my Notarial Commission, I solicit for my late partner, OTIS V. SAWYER, from the community, and particularly from my individual friends, their patronage in all things that require the services of a Notary Public.

23-4t W. W. WIGGINS.

Dissolution of Copartnership.

The Copartnership heretofore existing between George Gibbons and W. J. Woodley is this day, the 20th of April, 1864, dissolved by non-agreement of the above parties.

CAUTION.—The public against negotiating or purchasing any mining stock heretofore existing under and in said partnership.

GEORGE GIBBONS.

Santa Catalina Island, Los Angeles Co., 20th April, 1864. 21-4t*

Mission street (south side), just below Beale.

THE UNDERSIGNED PROPRIETORS ARE PREPARED TO manufacture all kinds of castings on the most liberal terms and on the shortest notice. Orders solicited.

N. SCHWARTZ,
R. SHIELDS,
D. S. DONELTY,
J. F. FLYNN

San Francisco, May 24, 1864. 22-tf

The Daily Evening Express, at Victoria, Vancouver Island is published by Messrs Wallace, Allen & Hardynge. Terms of subscription: One year, by mail, $10; six months, $6. It contains the late, Mining, Commercial, and General News up to the hour of going to press. Being the ONLY EVENING PAPER published in Victoria, and having a circulation equal to any other Journal in the Colony, it will be found an excellent medium to enable advertisers to bring their notices before the Public. W. H. TOBEY, Agent, Government House, San Francisco. 15-tf

Favorable to Inventors.—Persons holding new inventions in machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

American and Foreign Patents.—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Cortez Gold and Silver Mining Company, Cortez District, Nevada Territory,

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

San Francisco, April 1st. 1864. 14v8-tf

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep2f

WHEELER'S

Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

☞ These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

LLOYD'S NEW AMALGAMATOR

Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $40 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 600 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 15¾ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold	$73 33
Silver	42
To the Ton	$73 75

The assay being made by Messrs. Molitor & Co.

From 2½ pounds of the same ore, worked for the same party, was obtained:

Gold	$63 30
Silver	04
To the Ton	$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 34 per ton; and over the works at the mill, $62 34 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $4.19, Silver, $1.52, amounting to $2.71-100—equal to $361.33-100 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $.54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.

Result of 68 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Bowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 648-100. Assay made by Messrs. Molitor & Co. 140 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58-00—equal to $111.60 to the ton. Difference in favor of Lloyd being $104.58-100 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustell Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. etbween 3d and 4th.

Office, No. 302 Montgomery street, No. 7 and 8, 3d floor.

San Francisco, May 27, 1864. 22-2t

For Sale—A Useful Invention.—EDITORS PRESS:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a devise of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test, under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-4t

Rubicon Gold and Silver Mining Company, No. 4. Location of Mine, Keys District, Owens' River, Mono county, California.

Notice is hereby given, that in accordance with the laws of the State of California, and an order duly made by the Board of Trustees of the Rubicon Gold and Silver Mining Company, No. 4, there will be sold at public auction, to the highest bidder, for cash, in United States gold coin, on the 14th day of June, 1864, at 11 o'clock, A. M., of that day, at the office of the Company, No. 7 & 8 third floor, No. 302 Montgomery street, San Francisco, so many shares of the Capital Stock of the Company, standing in the names of the following persons or shareholders, as will be necessary for the payment of Assessment No. 4, of ten (10) cents per share, duly levied thereon February 27th, 1864, by the Board of Trustees, together with the expenses of advertisement and sale, unless said Assessment and accruing charges are previously paid.

Office, No. 302 Montgomery street, No. 7 and 8, 3d floor.
San Francisco, May 26, 1864. 22-2t

MINING AND SCIENTIFIC PRESS.—This is one of our most valuable exchanges. It comes to us filled with the most valuable articles, original and selected, upon the subject of mining, and we scissorize it to an awful extent. Every person engaged in mining to any extent, should be a subscriber to the PRESS.—*Gold Hill News.*

Rubicon Gold and Silver Mining Company, No. 3. Location of mine, Keys District, Owens' River, Mono county, California.

Notice is hereby given, that in accordance with the laws of California, and an order duly made by the Board of Trustees of the Rubicon Gold and Silver Mining Company, No. 3, there will be sold, at public auction, to the highest bidder, for cash, in United States gold coin, on the 14th day of June, 1864, at 11 o'clock A. M., of that day, at the office of the Company, No. 7 & 8 third floor, No. 302 Montgomery street, San Francisco, so many shares of the Capital Stock of the Company, standing in the names of the following persons, or shareholders, as will be necessary for the payment of assessment No. 4, of ten (10) cents per share, duly levied thereon February 27th, 1864, by the Board of Trustees, together with the expenses of advertisement and sale, unless said assessment and accruing charges are previously paid.

Mechanical.

REYNOLD'S

Patent Cut-Off and Governor,

For Steam Engines.

127 of these Invaluable Machines

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 75 per cent of the Fuel.

Steen's Improved Governor

IS THE CHEAPEST, SIMPLEST AND QUICKEST TO ACT AND least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, at the Stone Breaker, foot of Montgomery Street and at the Sugar Refinery, 8th Street, San Francisco.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., Etc., bought and sold the best market rates.

Anti-Incrustation Powder,

A sure remedy for Scale in Steam Boilers, without injury to the Iron. In use for the past EIGHT years.

☞ MACHINERY MADE AND REPAIRED. ☜

Sugar Refinery, San Francisco,
Cotticli & Co., San Jose,
L. A. Booth, Esq., Virginia City,
And 2,000 others in the United States.

E. T. STEEN.

1-tf Nos. 37 & 39 Fremont Street and 42 & 44 Beal Street.

MINERS' FOUNDRY

—AND—

MACHINE WORKS,

First street, between Howard and Folsom streets,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the **Best** and **Most Economical**, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

☞ Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

tf. HOWLAND, ANGEL & KING.

PACIFIC IRON WORKS,

First street, between Mission and Howard streets,

SAN FRANCISCO.

GODDARD & COMPANY,

—MANUFACTURERS OF—

STEAM ENGINES & BOILERS,

QUARTZ, FLOUR, SAW AND SUGAR MILLS,

AMALGAMATING PANS AND BARRELS, MINING PUMPS AND HOISTING GEAR, WATER WHEELS,

And Machinery of Every Description.

Also furnish all kinds of Iron and Brass Casting. Only Manufacturers of the celebrated Bryan Battery. 14-tf

---

THE ATLAS IRON WORKS,

No. 24 & 26 Fremont Street.

—MANUFACTURE—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangments will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

IMPROVED WATER-WHEEL,

—PATENTED BY—

John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER GENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easie-t regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,

PUMPING, HOISTING, MINING AND QUARTZ-CRUSHING Machinery. Shoes and Dies of the hardest iron. Russia Iron Punched Screens, Steamboat Machinery, Saw, Flour and Sugar Mills. High and Low Pressure Boilers of all styles. JONVAL and other Turbine Water Wheels with latest improvements.

tf No. 187 & 139 First Street San Francisco.

LEANDER RANSOM,

Civil Engineer and Surveyor,

HAVING BEEN CONNECTED WITH THE PUBLIC WORKS OF the State of Ohio for 20 years, and the public surveys of the State of California for 7 years. Also

State Locating Agent,

AND AS SUCH HAVING THE SALE OF

600,000 Acres of State School Lands.

At the low price of $1,25 per Acre.

TERMS—Twenty per cent in cash and the balance on a credit of several years.

oc7-tf Office, 328 Montgomery streets.

JOHN TAYLOR,

—IMPORTER AND DEALER IN—

Druggists' and Chemists' Glassware,

And a Full Assortment of Assayers' Articles.

—INCLUDING—

Bullion and Assay Ballances, Furnaces, Muffles, Crucibles, Cupels, Acids, Etc., Etc.

Also—A Full Assortment of Reagents.

JOHN TAYLOR,
2-tf 514 Washington St., Up Stairs, San Francisco

W. W. HANSCOM,

Steam and Mechanical Engineer. Designs furnished, and Drawings made for Engines, Mills, Water Wheels, Mining Machinery, etc., etc. Agent for McKenzie's Patent Cupola and Blower.

At the Golden State Iron Works,

First Street, San Francisco.

tf.

Boston Mastic Roofing.

WE ARE PREPARED TO FILL ALL ORDERS FOR ROOFING throughout the State, Mexico or Nevada Territory. The attention of miners and mill owners are especially called to this notice, it being the cheapest and most economical roofing in use.

Office 135 Montgomery Street, near Bush, San Francisco.

10v8-2m N. P. PERIN & CO.

BLASTING POWDER!

Prime Blasting Powder, on Consignment

And for sale in lots to suit purchasers, by

J. S. CURTIS,
6v8-tf No. 405 Front street, San Francisco.

WANTED,

Gold Quartz suitable for Cutting Jewelry.

By FRONTIER & DEVIERCY.

437 Pine Street, San Francisco.

VOLUME VIII. SAN FRANCISCO, SATURDAY, JUNE 11, 1864. NUMBER 24.

OLD COUNTRIES AND NEW.

People who live in old countries, like those of Europe, for instance, realize but very little how much they are indebted for what they enjoy to the civilization of the many centuries that have passed before them. The clearance of forests, the drainage of lands, the construction of roads, bridges and public edifices, the establishment of colleges, academies and other institutions of learning and literature, are found all ready for their use and enjoyment when the people of the present generation, in such countries, come upon the stage of action. All these things the hardy pioneers in a new country are obliged to build up in a single generation. The weight of such a burthen can never be realized until it is actually felt. Take an entire community, old and young, that have been brought up side by side, and their predecessors before them for centuries, intermarrying with one another, and living mainly upon what their parents have left them—take such a community, and transplant it bodily into a new and distant land, and the result would most likely be a perfect failure. New countries are not thus peopled; they could not be thus established. It is one of the sequences of civilization that all old communities should send out pioneers to occupy new and distant lands, and thus gradually reclaim them from nature's wastes and savage rule, and add them, one after another, to the great brotherhood of civilized nations; but those who thus go out to prepare the way are usually the most hardy, active and intelligent of the parent community. Men of inferior stamp prefer the luxuries and leisure of home. They would be drones in a new community—merely drags upon its progress.

In the early ages of civilization these migrations were comparatively rare and slow of results. The introduction of steam and machinery has of late years given a wonderful impetus to such movements, and we can now look forward to an early day as the period when every approachable shore line on the globe will be planted with colonies of hardy pioneers, which will form the nuclei of peoples that will, ere long, knock for admission into the growing family of nations.

It is marvellous how rapidly a modern colony, assisted by the mechanical and scientific aids, which are now the never failing accompaniments of such movements, will gather around itself all that can minister, not only to its absolute needs, but to its comforts and luxuries as well. When a stranger arrives for the first time in San Francisco, he is amused at the maturity which the city presents, and can scarcely realize, as he looks around at our well paved streets, threaded by a net-work of railroads, our numerous churches, school houses, theaters, splendid hotels and imposing charitable institutions, that he is walking the streets of a magnificent city of 135,000 inhabitants scarce fifteen years old! Let him step on board of one of our splendid river steamers, wend his way mountain-ward, and make a hurried trip through the mines, and he is still more amazed at the immense amount of labor which has there also been accomplished in so short an interval. Californians may well be proud of the indomitable energy and activity which they have displayed, and each may rejoice that his lot has been cast among a people by whom so much has been attempted and so much accomplished, and that, too, at such a vast remove from the centers of civilization. The like was never seen before.

For a full century the thirteen provinces which formed the basis of our present Union were struggling along in the pathway of nationality, under the old-time regime of slow coaches, hand labor, and the dull routine in which our fathers for generations before had trod. The short-sighted policy of the mother country, in cramping the native industry of the people, roused their Saxon blood, and the Anglo-American was suddenly awakened into a new life. His first effort was to assert and achieve nationality. The industry and energy of the people then took a more practical turn, and, aided by the genius of a Franklin, a Fulton, a Whitney, and a host of lesser, though still brilliant lights, which immediately sprang up, the American people have since taken the lead in everything which relates to progress, whether religious, political, or industrial. For many years their surplus population found an outlet in the "boundless west," until, by the fortuitous circumstance of the discovery of gold, their attention was attracted to California, where the first distant American colony was established. The energy of our people has fully maintained its pre-eminence, as we have already shown, in the work which they have here accomplished.

Human intelligence and human hands have never done more, in the same space of time, to develop the resources of any country, or been more ready to seize upon and turn to profitable account the boundless latent wealth of magnificent territory! It is difficult to conceive of any material obstacle to our onward progress, or the unlimited expansion of the Anglo-American race on the Pacific coast of the American continent. Californians are the true modern type of a pioneer people. If, in our vigorous growth, there should be observed an absence of some of the amenities that belong to the more polished phases of life in older countries, their want is more than compensated by the unusual stimulus of active, useful exertion, which abounds, and the true open-hearted generosity which our citizens manifest on all occasions, where charity, philanthropy or patriotism makes a call upon their efforts or their purses.

El Dorado Canon.—It is stated that there is a sufficient amount of rich rock now lying in El Dorado Cañon, on the Colorado, to employ a dozen or more 40-stamp mills for six months. Parties from that region give it as their full conviction that mills are now the first and greatest necessity for carrying on a successful and paying work in El Dorado Cañon. As quite a number of fat owners from there are now in this city, it is to be hoped that on their return some arrangements will be made by which this great want will be supplied.

The Patio Amalgamation.

BY J. H. CHURCHILL, A. M.

[CONTINUED FROM PAGE 361.]

From this inefficiency of the crude salt earth originated the use of processes of leaching and evaporation to purify the salt. Crystallization from salt-springs supplied it purer in the district of Salinas. The purest salt is that obtained by evaporation of the sea water; but it is kept from general use by the distance and cost of freight. The latter will contain within three per cent. pure salt. On the contrary, the best of the other sorts, even when purified by the methods mentioned, will afford only little more than nine-tenths of their weight; but they differ from the original salt earth, in being free from lime and magnesia in a form which may absorb the hydrochloric acid as fast as liberated by the decomposition with the magistral. The following analysis, selected as showing the mean composition of Mexican purified salt, exhibits these earths, in combination already either with that acid, or the stronger one, sulphuric acid:

Chloride of sodium	90,372
Chloride of magnesium	2,570
Chloride of calcium	1,410
Sulphate of potash	2,450
Sulphate of soda	1,105
Sulphate of lime	2,090
	99,997

The proportions, which I shall presently mention, for the use of salt, are therefore made in reference to a purified material of about this standard.

The pyrites from which the magistral is obtained by roasting may be considered as nearly free from any similar sources of counter re-action with the salt. The quantity of lime, alumina and magnesia likely to be present may be gathered from the following table of the composition of the averages of the copper ores smelted at Swansea:

Silica	38.5
Alumina	2.4
Lime	.3
Magnesia	.4
Copper	13.5
Iron	19.7
Other metals	.9
Sulphur	23.1
Water, oxygen, carbonic acid	1.2
	100.0*

At Copiapo, in Chili, the sulphuret of copper and iron will contain 12 to 13 per cent. of materials other than copper, iron, sulphur and silica. All the carbonates of the earths, magnesium or other limestones will, of course, be converted into sulphates in the roasting, and will neutralize an equivalent proportion of salt only in proportion to the soluble alum, or sulphate of magnesia (epsom salts) resulting from the manufacture.

The composition of the gangue of the ore is of still more importance in this respect. Ores from the district of La Luz sometimes contain nearly ten per cent. of carbonates of lime and magnesia, and as they do not contain sulphurets of a character to require roasting—which is scarcely attempted about Guanaxuato—these enter the torta in this condition. The Santa Brigida vein, in the Real del Monte district, yields even more; alumina, magnesia and lime amount in this ore to above 11 per cent. Possibly all of this is not so readily attacked as in the form of carbonates; but in the district of Reyes, five per cent. of these carbonates is again common. I lay more stress on this point here because, in addition to

being of importance in the Patio process, as accounting for irregularities in the results and of the quantities of the materials to be mixed, it also seems to me to afford the clue to the inefficiency of certain powerful chemicals used in limited quantities by numerous pan amalgamators in this State.

In considering the proportions in which the materials are to be mixed, it is well to recall the nature of the silver present (see our number for May 14th, p. 323). The metallic silver and the native silver amalgam are mostly removed by the process of amalgamating, which is carried on in the arrastra when a little free gold is also known to be present. For this purpose the refuse (cabetilla) from a torta, and sometimes additional silver amalgam, is put into the arrastra, for the purpose of collecting the gold into as small a quantity of amalgam as possible, and if the quantity of native silver be not very large, it may be wholly withdrawn by this means. Some action also goes on here directly, and without any other agency than the constant attrition, between the mercury and the sulphides of silver, with the production of sulphuret of mercury and amalgam. We have, therefore, somewhat less silver, even in a mineralized form, than was originally contained in the, ores after the grinding in the arrastra, whenever amalgam or mercury is added during the operation.

Taking, then, the average content of Mexican silver ores submitted to this process as 5 to 10 lbs. per ton—*i. e.*, one to two parts in 400—the magistral will have been made from ores of different contents in sulphur. As the standard, ores capable of yielding 30-50 per cent. of sulphates of iron and copper represent about the mean in the haciendas near Guanaxuato. The practice is to add about an arroba for each monton of ore. This will be in the proportion of about two to three pounds in four hundred.

The salt being true salt to the extent of nine-tenths, is added to the amount of two, three, five, or even eight per cent., in accordance rather with the necessities of the times than of the torta, as it is known that the larger proportion produces quicker work. A result sometimes attributed to its solvent action on the chloride of silver, but perhaps more truly due to increased action from its presence in larger quantities.

These materials have been added to—the proportions in which they are generally used, have been altered—the magistral has been substituted by other salts, chiefly for the following reasons: 1st. To economize the mercury, as was aimed at in the use of iron, in the metallic form, as long ago as nearly three centuries since, in Peru—an alteration which still survives in the barrel-amalgamation, known in this State as the Freiberg process. 2d. Salt, in increased quantity, imparts a very material result, which must be noticed more fully as we proceed. 3d. The addition of more than the usual quantity of magistral is employed with ores containing blende and galena, and the effect it produces in these cases has a very important bearing on the theory of this process in general. A practical chemist and an enterprising observer, Dr. Bowring, has written much to show the advantage of using sub-chloride of copper instead of magistral with the salt. It is suggested that this prevents the combination of chlorine and mercury; but the considerations drawn from actual working, which are the basis of the other modifications just mentioned, point very definitely to the conclusion that the magistral and salt perform other functions than that of furnishing chloride of copper to the torta; and an experiment of Dr. Bowring's own shows the advantage of some sub-chloride of mercury being present. Where additional magistral is necessary—with, as a result, the production of a larger quantity of hydrochloric acid—there we have present sulphurets, either in their native condition or remaining, as we have already remarked, after even the imperfect roasting sometimes employed with these argentiferous blendes; and these sulphurets doubtless exercise a negative influence and preserve the mercury, as well as the silver, from the continued or excessive action of this acid. But we have none the less reason to commend the practice alluded to, based, as it is, upon the effect of the additional acid liberated from the salt, which, when the magistral is employed in sufficient quantities, is active in destroying the combination of these sulphurets of zinc with the silver contained in them. I have spoken of the product of the action of the magistral on the salt, as nascent hydrochloric acid, it may practically be so regarded, for the persulphate of iron and the protosulphate of copper contained in it, each contain acid enough to liberate more hydrochloric acid than they can combine with, without again parting with it to mercury when this is introduced, or than they can combine with at all, when the mercury is present at the time. Experiments of my own, made directly to the above point, confirm the reaction. The observations of M. L. Malhè on the action of sulphuret of iron (artificial) on the salts of mercury and some other metals, will both illustrate the effect of the sulphurets present which I have alluded to, and may be worth remembering, in case of poisoning. It was in the latter cause that this chemist originated his investigations.

One of his experiments, if it were not dangerous, might be as convincing as it is easy of execution. It is the following: Take on the tongue just sufficient corrosive sublimate to produce the abominable metallic taste which distinguishes it; then rinse the mouth with water, into which some of the sulphuret of iron, precipitated by an alkaline sulphide, has been stirred, and the taste of mercury is at once destroyed. Mutual decomposition has resulted in the removal of the hydrochloric acid from the mercury, which rendered it soluble and capable of being tasted. The whole of it is substituted by the sulphur, and therefore, here the mercury is deprived of the lesser proportion of hydro-chloric acid with which it is combined in inefficient practice of the Patio Amalgamation. This action of sulphurets is not confined to these two combinations, and in some cases arsenical sulpburet of iron is one of the most effective. This observation has been confirmed by other chemists of authority.† It seems, therefore, to be well deserving of consideration. If the addition of magistral be continued beyond the point of destroying the blende or galena, we may have chlorine enough present to produce more than sufficient sub-chloride of mercury to keep the torta in good working order. It is this salt, the calomel of our druggists which forms the white powder, which may be squeezed from the mercury in the testing bowl when the process is going on well.‡ On the other hand, when this action is carried too far, we have the condition known as calor—destruction of mercury by chlorine. It is well worthy of remark that the action of artificial heat counteracts this condition of the torta, and we have the same re-action between the chlorine in combination with mercury and the sulphurets of silver as ordinarily with the chlorides of copper, which result in the formation of chloride of silver§. In this connection all the received additions of chemicals to the pan processes are dependent on the production of chlorine; and we may, therefore, see in this effect of heat in the Patio process a measure of the value of the artificial heat, which has been so much used with the former, but which some careful workers are now ready to dispense with. Again, the calor de frios is counteracted by the light and warmth of the sun and exposure to the air. The condition of the mercury in this case is said by Napier to be that of an oxide (suboxide). When this is the case, the sun acts on this by separating it into the combination of equal equivalents of oxygen and mercury, with the restoration of half the mercury to the metallic form—ready for amalgamation or—upon the addition of more magistral, the necessity for which is indicated by a yellow tinge, probably due to the oxide last mentioned—to be converted into subchloride, the presence of which, in limited quantities, characterizes, as we have seen, a successful mixture.

(To be continued.)

Brown's Valley.—An occasional correspondent of the Marysville *Appeal*, writes under date of May 30th, as follows: "There is a rumor afloat here that mining in this Valley, as well as in the other mining districts, will soon be revolutionized by a new theory laid down by one of our leading miners here. It seems even that our Pennsylvanin and Jefferson companies have already adopted this theory, and are now working their claims on an entirely new plan. If this theory holds good, and there is but very little doubt that it will, mining in future will not be a great deal more uncertain and risky than all other pursuits pertaining to soil, as raising grain, fruit, etc. According to this new theory the mines of Brown's Valley, for instance, would pay rich, and could not be worked out for hundreds of years to come. The newly made discoveries in the Jefferson and Pennsylvania claims seem to warrant the assertion that their cleanings up will not only soon restore confidence entirely, but they will also show at once and forever the real and intrinsic value of our mines."

The above correspondent complains that the parties who have proposed and adopted this "new theory," do not make their discoveries public, for the benefit of others. If it is simply a theory with regard to the formation or working of veins, the discoverers certainly cannot make themselves any poorer by doing so. Our correspondent, who signs himself "A Miner," in another column, gives quite a full description of the present underground condition of the mines alluded to above.

[Written for the Mining and Scientific Press.]

From Our "Sage Brush" Miner.

Austin, May 29th, 1864.

Editors Press:—Since I wrote you last but little of an exciting character has transpired in Silver Land. The preparation for a glorious future is steadily going on and all are sanguine in the belief that whatever they invest will ere long bring them an hundred fold. Though mining has been somewhat retarded for the past few weeks by reason of stormy weather, now that the sky is again cloudless and serene, everybody seems inspired with new life and brighter hopes. Miners swarm among the hills and countless windlasses are turning up the cubic contents of 5 by 6 in order to disclose to those who merit it an ample reward for all their toil.

The husbandmen too are delighted, though at the eleventh hour, to see their pastures and meadow land again resume the rich carpet of green which promises for them an abundance. Having had here, as was the case generally in California, an open and pleasant winter, it is now, late as it is, cheering to receive refreshing showers of rain. Even the desert plains seem to rejoice thereat, for the very sage brush is trying to shake off its rusty, dusty appearance and to don a new dress.

Notwithstanding the scarcity of capital here at present, the town of Austin is improving rapidly. Everybody who has a few dollars to spare is laying it out in building or in improvements of some kind. This should prove to our neighbors at a distance that we are grasping after no imaginary object, but that the end, real, lasting and substantial, is in view. Austin, situated as she is upon the main overland road, with rich mining districts both north and south, cannot fail to remain the head quarters or common center of the surrounding country. Amador on the north, Big Creek or Cañon City, Bunker Hill and Kingston on the south, also Union and Ione City in a westerly direction, are all but as swarms gone out from the old hive and still the business-like appearance at home is not diminished, but on the contrary the old hive, has received additions in the shape of extensions No. 1 and No. 2 to town plat original. Already teams from Salt Lake have made their appearance in the street, with bacon, butter, eggs, etc., which assures us that we may expect from that quarter a lively trade, and together with the emigration that may stop here, we cannot but describe for Austin a still larger boundary than she at present claims. In all fairness we cannot but predict a promising future for our sister towns; for with us their common destiny is onward.

Of the various claims here, I need not undertake a description, for as the miners are at work with a purpose, and free good will, they will soon speak for themselves. I am glad that the mania for incorporating has in some degree subsided, and that labor or actual development of the mines is substituted in place of finely lithographed certificates of stock. Capitalists are not going to make large investments in claims on the recommendation merely of the paper on which they are represented, and I am glad to say we have already some claims here that will pass inspection.

Freight teams are arriving daily from California, that keep our market well supplied, and taking into consideration the price of hauling so far, living here is very reasonable. Some restaurants are even furnishing meals, (and not indifferent ones either,) for 50 cents. Milk flows into our town freely, I say *milk* not *water*, for the reasonable price of 50 cents. per gallon. Our meat markets are supplied with beef, mutton and pork, and ere long we may expect to see fresh garden vegetables, for an abundance are growing and looking finely. Taking it all in all, Reese River is not so bad a country after all. Many a peaceful home will have its altar erected here, and the desert be made to blossom like the the rose; at least such is the opinion of Sage Brush.

The Sandwich Islands Aiding the Sanitary Fund.—Some 500 barrels of molasses, contributed by the various plantations in the Sandwich Islands, have already been shipped from New York. Another shipment will soon be made.

Mining Accident.—A workman, named Dennis Hickey, fell a distance of 100 feet, from an underground scaffolding, down a shaft, in the Gould & Curry mine, on the 1st inst. He struck upon a bunch of picks, and was instantly killed.

[Written for the Mining and Scientific Press.]

The Mines of Amador County.

Messrs. Editors :—Having examined the chief points of interest along the copper belt of Amador county, I next turned my attention to the auriferous veins a dozen miles west. This class of veins, more than any others, require a rigid examination for a proper appreciation of their true worth. As in silver mining, the local or easily visible richness of the rock is not a sure criterion of the value of the vein. The richest rock that I saw on my trip came from the least valuable lode for profitable working. Without, therefore, expressing a positive or negative opinion concerning the claims encountered on my route, I shall proceed to give a few facts acquired in a not very prolonged inspection of the most accessible mines.

At Jackson several shafts and cuts are being sunk upon veins of auriferous quartz. The only one I particularly examined is situated about a half mile south of the town and is owned by the proprietors of the Eureka and Badger mines, at Sutter Creek. The vein consists of several seams and bunches of friable quartz in a rotten bed rock; that to the west being composed of clay slate and that to the east evidently trap rock. From an excavation about ten feet in depth and one hundred in length, the quartz had been taken out for a width varying from four to ten feet. The day previous to my visit, a piece of quartz containing one hundred dollars in gold had been found quite near the surface. The general run of gangue excavated yields about five dollars per ton although selected rock has gone as high as thirteen dollars. The rock is hauled to a little four-stamp mill driven by a water wheel, near town, where it is crushed at a cost of three dollars per ton. The proprietors of this as well as other quartz mills in this section allege that the expense of crushing does not exceed one and a half dollars per ton. This mill if effective in saving fine gold, quite upsets my ideas of the necessary requirements; the wash of the battery passes into a bowl connected by a central hollow cylinder with a saucer shaped disk rapidly whirling in an iron pan, and after passing beneath the convex muller flows through a short string of sluices.

Further south a company of negroes are prospecting the vein I have just noticed.

Two miles north of Jackson is the Oneida Quartz Mill of twenty stamps, which dates back its existence to the year 1852, although in possession of the present three proprietors but three years. The mill is crushing rock from two claims. The one close by is a vein of hard white quartz from two to six feet wide, and enclosed between walls of black slate, with a shaft down some three hundred feet. The second claim, three quarters of a mile south, yields a peculiar slum or orange colored, flinty quartz from a shaft eighty feet in depth.

Next, proceeding to Sutter Creek, a town supported almost wholly by quartz operations and subject to none of those fluctuations of business or population discernable in the desolate ruins of many other mountain towns, I gave special attention to its mines, which have been more steadily worked than any other in California. Nearly a mile back on each side of the creek, which is a considerable sized stream flowing westward, a high ridge curves in general contour with its course. From each of these ridges drops a prominent north and south spur on or near which summit is located a line or range of auriferous quartz. The veins occur near the junction of a greenstone with the eastern side of a clay slate formation. The slate comprises a belt about a thousand feet in width, flanked on either side by the bluish green, and sometimes distinctly porphyritic rock, which is plainly marked in its course by its associated red earth caused by the decomposition, into red oxides, of the iron sulphurets abundantly entering into its structure. It is this rock more than any other in this geological system of our State that possesses an auriferous character and gives a red color to the best placer deposits.

On the east side of a ravine through which the Jackson road descends to the town of Sutter Creek, and a quarter of a mile back from the creek, are the Badger and Eureka mines, formerly separate claims, but now jointly owned and worked by Messrs. Heywood and Chamberlin. These claims were located in the year 1852. Inside the building belonging to the old Eureka mine there are two shafts, 600 and 800 feet respectively in depth, to each of which there is attached a twenty-horse power engine for hoisting quartz and water, the latter, however, not in any great quantity. In the Badger building, three hundred feet south and higher up the hill, is the third shaft seven hundred and fifty feet in depth and connected with an engine of equal power with the others. All three of these shafts are constantly used in working the mine night and day. At times the quartz taken from the two mines gives activity to three mills or seventy stamps in all. During my visit but one mill of forty stamps was thus engaged. About one hundred men are employed in the mines and mills. The quartz pays from fifteen to thirty dollars per ton.

Having expressed a desire to descend into the deepest mining shaft in California, I was proffered the opportunity by the foreman of the mines, Mr. Morgan Morgans, whose eight years experience in these claims gives him a thorough knowledge of every portion of the underground work. Proceeding to the southern shaft of the Eureka mine, I took a candle in hand, stepped into the large iron bucket, and squatting therein, became oblivious to any other than a highly elevated view of the outer world. My guide balanced himself on the edge of the bucket and grasping the chain below the rope gave orders for an easy descent. The engine started, the reel set free coil after coil of rope, and we passed down quite easily with scarcely enough danger depicted in the attachments of our iron chariot to give the excitement and consciousness of braving danger, such as can be felt in descending the slimy ladders and rickety shafts of some mines. The shaft, inclining with the ledge at an angle of eighty degrees, is about seven by five feet in the clear, heavily timbered and contains, like most shafts of the same capacity, two sets of tracks or slides for the buckets and a side ladder. At the depth of five hundred feet, a pull on a wire gave a tinkling signal for stoping the engine, and we landed at the end of a drift running northward. Passing through this, over and beyond the north shaft, we came to the most northernly exploitation on the vein where it shrinks to a width of about twelve inches. Returning south to a point near the old division of the line of the two mines, we found a party of workmen engaged in prying down the masses of quartz shattered by a blast that we had heard and even felt, reverberating through the mine, a few moments before. Here the vein is sixteen feet in width, but elsewhere chiefly ranges from six to ten feet. A large flake of solid quartz weighing about twenty tons, lay on the floor of the excavation awaiting the necessary blasting that must precede its removal, while smaller blocks were being tumbled to the bottom of the shoot where they appeared to break into fragments with a crash. The quartz of the entire vein is taken out with no attempt at selection. The vein here, as well as throughout the full workable length of six hundred feet, shows two distinct parts created by the peculiar arrangement of the thin, bluish black bands of slate that give divisional markings to the quartz. The more narrow portion next to the hanging wall is much more finely and frequently dissected by the slate lines than that next to the foot walls where the quartz is but massively divided by vertical curving, and, occasionally connected, black streaks. Even in their close assimilation these two divisions have not only different values but titles decreed to them by the miners. That next to the foot wall is known as the boulder ledge, because in sinking the original shaft this portion only joined the other after a certain depth had been reached on what is known as the quartz ledge. The vein dips east at an angle, as before stated, of eighty degrees. The foot wall is composed of a black iron slate, extending back a hundred feet or more to the clay slate proper, and near the lode filled with knotty nodules of quartz. The hanging wall is greenstone, hard and smooth of polish, with occasional inequalities. It is marked by many horizontal veins of quartz one and two inches in width and nearly two feet apart, linked together by smaller vertical seams. These small veins have no direct connection with the mass of the ledge, but undoubtedly are feeders of the metallic wealth. Sometimes a vertical break or step three or four inches in height, occurs along the hanging wall causing by its influence a regular separating seam or fracture clear across the vein. After descending within a few feet of the bottom of the deepest shaft which workmen were timbering, we entered the lower drifts north and south, above which the quartz had been taken out for some distance. Here we had startling evidences of the great pressure exerted upon the timbers of this mine, which are required to be replaced where continuous openings are necessary every six months. Posts and sills three feet in diameter were jammed into splinters and the ends of others driven as closely through the sides of those against which they had been braced as if fired from a swamp angel. Singular as it may seem to the uninitiated, this immense pressure is not due to the over-hanging, solid mass of trap, but to the downward pressure of the less stable iron slate of the foot wall. After ascending a short distance by a ladder and traveling over a few places where the only footbold was afforded by the round smooth surfaces of timbers set far apart, and where caution demanded a tight grip of the projections of the walls and posts before a move was advisable, we entered the Badger shaft and were soon on our way to the surface by the same mode by which we had accomplished the descent. A portion of the distance the shaft is quite contracted, where, in spite of this semi-annual timbering, performed here as well as in the other shaft, the walls which eight years ago were eight feet apart have managed to approach within four feet of each other. In a ravine near by, a recent depression marks a settling in the mine but fortunately the character of the surrounding ground indicates no danger and but little inconvenience so long as the needful openings are timely and properly timbered.

Half a mile north of the Sutter Creek is situated the Lincoln Quartz Mining Company's claim of 2100 feet, first located in the year 1850. It has a shaft down four hundred and fifty feet, which is worked by the aid of a twenty-horse power engine. Twelve hundred gallons of water are hoisted from this shaft every hour. The ledge for a distance of one hundred and twenty-five feet, averages a width of six feet, of which about two feet of quartz, next to the hanging wall, is bluish grey in color, and contains fine particles of gold, mostly in the fine slaty seams, the balance, a milk white quartz, holds gold of a coarser character. The vein runs in line with the Eureka and Badger, about fifteen degrees west of north, and has the same dip and wall rocks. The quartz gradually grew poorer in gold from the surface to a depth of four hundred feet, since when it is said to have turned out richer than ever before. The rock is claimed to yield from thirty-five to forty-five dollars per ton. One hundred and twenty tons are extracted monthly and crushed at a sixteen-stamp mill near by. From one to two hundred feet east of this ledge are a number of shafts and openings on veins and seams of quartz in the greenstone, some of which are being worked to a slight depth, and are said to yield the prospectors moderate returns.

M.

The English National Debt.—England, during her wars, has had occasion to borrow large sums of money. Her subjects have been appealed to in much the same manner as the people of the United States have been called upon by the Federal Government, to furnish the "sinews of war" in our present struggle. The appeals in both countries have been patriotically and promptly answered. The English Government, in calling for these loans, has done so with the express stipulation that re-payment could never be called for, except at the option of the Government. The interest, only at a stipulated rate, could be demanded. These loans are now known in England as the "funds," or "public securities." The loans asked of the people by the Government at Washington are to be repaid, both principal and interest.

Gold on Lake Superior.—The reports of rich gold deposits on Lake Superior, long deemed fabulous, appear to be in a fair way to full confirmation. Letters state that there can be no doubt of the existance of valuable gold deposits in and around the Huron Mountains. Preparations have been made for a thorough exploration. The Houghton *Mining Gazette* has the following editorial paragraph, the editor having just returned from the district where the gold veins are said to exist: The discoveries in gold bid fair to eclipse, by far the most sanguine expectations ever formed of the silver lead. At first, the analysis showed an amount of gold in the pyrites of iron, equal to from $60 to $100 per ton of ore. Other samples have been obtained within the past three weeks, which upon analysis, have, to the astonishment of everybody, yielded as many and in some cases, more ounces of gold, than it had before shown dollars' worth. These analyses have of late shown one pound of gold per 100 lbs. of clean ore, and one of them made by Mr. Williams this week, has shown *thirty two pounds* per ton, and had he the facilities to make a complete analysis, it would have shown a small amount more. Large entries of land have been made in and around the Huron Mountains, and we hear that 13,000 acres of land were taken up last week. But little more land has been left for entry in that section, we would think, and another field must be found for operations.

BRIEF MENTION.

The continued drought has seriously affected the wells throughout Napa Valley—so much so that some wells, formerly abundantly supplied with water, have entirely dried up.

Judge Carter, of Amador county, has presented his valuable collection of minerals (said to be the finest private cabinet in the State) to the State Agricultural Society.

A monster cheese, weighing four thousand pounds, made by T. F. Neagle for the Steele Brothers, of Santa Cruz, will be exhibited at the Mechanics' Fair in this city, and afterwards donated to the Sanitary Fund.

Fourteen citizens of African descent have organized themselves into a quartz mining company, in Mariposa county, and are taking hold of their work with commendable energy and enterprise.

The citizens of Grass Valley, Nevada county, have already contributed $1,400 towards celebrating the Fourth of July, and funds are still coming in.—This is the way that California mines "give out."

The people of Nevada City are raising a fund to build a branch road from that place to Bear Valley, in order to connect with the Pacific Turnpike.

The track of the Pacific Railroad is completed as far as New Castle, and in a few days the Company will receive freight at that point, where they have a commodious depot.

The Amador and Nevada Wagon Road is now open and in good traveling condition.

In Copper City, Shasta county, they are trying to get a mill, and they say that the miners are taking hold of the enterprise; if that is so the thing is done.

The controversy between a portion of the Board of Supervisors and the vote of the people of this city on the subject of the city subscription to the Pacific Railroad, has been finally settled by a decision of the Supreme Court, requiring the Supervisors to subscribe the amount voted for.

The first telegram between San Francisco and the new summer resort, Calistoga Springs, was flashed over the wires last week. To the energy of Sam Brannan all seekers after pleasure or health are indebted for this much wanted institution in our State.

The steamer St. Louis, on Friday last, carried away $1,338,428 of treasure; $1,064,364 was for England.

San Francisco proclaimed literally from "the house tops," on Thursday, that she was loyal to the core. Not a flag staff was to be seen without the flag of the free floating from it, in honor of the re-nomination of Abraham Lincoln, who has "made his calling and election sure."

Secretary Chase sold a million in gold at New York, on June 2d, at 90 and 91.

On the East bank of Carson river there are said to be 100,000 acres of timber land, and the Washoe miners and mill men have already cut and used 250,000 trees from that section.

Sixty head of fine horses, under the guardianship of Capt. Evans, who left the Missouri river on the 6th of April, have arrived in good condition at Virginia City.

The Indians in Humboldt county, N. T., are getting troublesome. A company of Uncle Sam's boys from Fort Churchill have been sent after them.

According to the Oregon papers, the grain crop in that State will be fair. The plums, cherries and other early fruit will fail, but plenty of apples, pears, etc., may be expected.

Sudden deaths are becoming very common occurences. A man named Hennison, aged about 51 years, dropped dead in a saloon, in Gold Hill, N. T., on Monday last, and the wife of Sheriff Gasherie, of Carson City, dropped dead in her house while attending to her domestic duties, on the the same day.

Immigration.—An unusually large proportion of the immigration arriving from over the plains, is stopping in Nevada Territory.

Something of a Depth.—The Gould & Curry Mining Company intend having a forty-horse power steam engine set up in their mine, over four hundred feet below the surface of the earth. It is to be placed there to hoist water and ore from even a still lower depth.

Generosity.—The Bank of England has given a bonus of ten per cent. to all its clerks, on account of the remunerative business done. The example is worthy of emulation by our banks here, who have equally profited in the good time of full coffers. What say you, gentlemen?

On Tuesday, June 7th, an election for Town Trustees was held at Gold Hill, N. T., and the entire population of that flourishing town turned out to vote, being divided into two parties, known as "White Shirts" and "Blue Shirts." An exchange says that the whole thing, when analyzed, resolves itself into the question as to which of two officials in the town are the most popular with the people.

Ill Luck.—A merchant of Philadelphia, who a few years ago was reported to be wealthy, and making annually from five to ten thousand dollars, is now a driver on a passenger railroad car, at nine dollars per week.

Nothing remarkably strange in the above to us. We can point out any quantity of individuals in this city who have been worth their hundreds of thousands, some of whom have now hardly a shoe to their foot. This is hard to realize; nevertheless it is a fact.

Is It So?—We have been repeatedly asked—for reporters are supposed to know everything—if the dividends which were declared by the Pride of the West Mining Company, during the past few months, were legitimate ones, or on the "*cooked* order?" From what we can glean, really we cannot give a definite opinion; but if reports are true, we would be inclined to say they were "*cooked*," and what is more, decidedly *well done*—almost too well done for some parties that bought in at the rate of $84 per share, b 30. No doubt they considered it a *rare* opportunity to invest *permanently*.

False Pride.—The other day while standing on Montgomery street, we perchance overheard the conversation of a party of swaggering youths, scarcely out of their teens, and who were dressed up in the latest approved style, conversing relative to the great difficulty in obtaining respectable employment in this city. One maintained that the idea of lounging up and down the street, playing the part of a broker, was nearly played out with him—another said that what he wanted was a first class situation, something "high toned" and if he could not get such employment as that, which he considered respectable, he would continue in his present line of business—that of general inspector of sidewalks. Now, in looking over some eastern exchanges our eyes fell upon the following, which we extract and publish, being as it is, very suitable for the occasion, as there are many more in this city, similar to the above youths, who are almost starving, waiting for what they term some respectable employment, before they go to work. To them we most respectfully dedicate this paragraph:—

"The idea of 'respectable employment' is the rock upon which thousands split, and shipwreck themselves and all who depend on them. All employments are respectable that bring honest gain. The laborer, who is willing to turn his hands to anything, is as respectable as the clerk or dapper storetender. Indeed the man who is ready to work whenever work offers, whatever it may be, rather than lie idle and beg, is a far more respectable man than one who turns up his nose at hard labor, wearies his friends with his complaints because he can get nothing respectable to do, pockets their benefactions without thankfulness, and goes on from day to day, a useless, lazy grumbler."

Copper Mines in Washoe.—The Virginia *Enterprise* thinks that capitalists in making silver and gold investments in Nevada Territory have been too ready to overlook the important fact that the Territory has other interests, and other deposits of metals precious and valuable in commerce, the yield of which must make Nevada still more famous for metallic wealth than she now is. Prominent among these are the copper mines, to which public attention is now being so profitably turned in California, and giving promise that at no very distant day the exports of native copper will reach close up to those of gold. The *Enterprise* refers its readers to the late important copper developments in Peavine district, on the Henness Pass, an important and growing mineral region, situated directly on the great line of travel between Washoe and California, and through which the Pacific Railroad must soon pass. It is suggested that it would not be amiss for those who take an interest in our mineral lands to examine the claims of the Peavine District. There is undoubtedly a vast deal of mineral wealth in the Territory which is little known or thought of. The copper veins have not received that attention which their importance demands, and we doubt not but such as engage in the development of leads producing this metal will soon find themselves amply compensated.

We clip the following from the Reese River *Reveille*, of June 4th; it breaths the true spirit:—

Californania.—We confess to a yearning for the good old State just over the summit. It may be because we still consider ourselves fresh imports. It is true few men have visited and left California without expressing an almost unconquerable inclination once more to return. The causes of this deep-rooted attachment are varied and many. From the good old days of "forty-nine," to the present, the people have retained the characteristics that belong to cosmopolitanism. Those who were successful became none the less generous that good fortune had fallen to their lot, while the still larger class that adversity had marked for her own, still hopefully battled against fate, and in the face of repeated failure gathered new strength and resolution from the contest, and thereby contributed in no small degree to the prosperity of the State. We are not insensible to the fact that everywhere are croakers predicting a paralyzed future for the Queen State of the Pacific; but to the superficial only come these desponding illusions—her destiny and prosperity and ours are inseparable; unlike in many respects, yet clinging to each other the more closely, from that same dissimilarity they will harmoniously move among the sisterhood of loving States, striving only to excel each other in industry and in devotion to the Union.

Excitement Dying Out.—We have seen a letter recently received here from a responsible party in the East, who states, regarding the mining stock excitement, the following:—"The excitement in mining stocks in New York and Boston was what I predicted in the first instance—that it would be only a temporary affair, and, in fact, a 'nine-day wonder.' It has commenced already to subside. If any of your friends are laboring under the impression that they can dispose of any quantity of mining stock at fabulous rates here, they will be very much mistaken. Don't leave San Francisco, then, with that purpose in view, for it is all a delusion. If they take my advice they will remain where they are." In connection with the above we clip the following: "The New York *Herald* estimates that about one hundred and fifty millions of dollars have been invested, in New York and Boston, in mining companies, mostly bubbles."

Killed by a Cave.—A man named Patrick Norton was killed by a cave, on Saturday last, while working in the street cut on Broadway, between Montgomery and Kearny streets, in this city.

New Mill.—The Columbia Mining Company, located near Columbia, Tuolumne county, were to have started up their new mill on Tuesday last. The Co. has 600 tons of quartz ready for the mill, and expect to find good pay. The mill has been put up under the direction of Mr. John Ferguson, of this city. Mr. Ahner Pitts, of Sonora, has taken charge of the works.

Summary of Mining News.

CALIFORNIA.

Rich Pay Dirt.—The Placerville *News* says that a day or two since Frank Goyan took a pan full of dirt from his claim, which on being panned out yielded $60. The claim is the old Wells, or H. A. P., on Cedar Hill, and was given up several years ago as worthless. It now belongs to Goyan and Dickerhoff. The tunnel is in about 1,000 feet, and several pans full have been taken out recently that yielded over an ounce of gold each.

Fine Mill.—Daegener's steam quartz mill, at Sugar Pine, Tuolumne county, has been finished, and commenced running about ten days since. It is pronounced one of the finest mills in the county, and runs ten stamps for the present. The mortar-block is large enough for another ten stamps should they be required. The engine is 44-horse power, and can easily drive thirty stamps. Mr. H. W. Reese, a skillful and competent assayer, has been employed by the Company to carefully sample and assay the rock taken from the different tunnels of this lode.—The assays indicate that the rock is very rich in gold, although it shows no free gold.

Nevada County.—A correspondent of the Nevada *Gazette*, speaking of the copper mining region in the southern portion of that county says that a fresh impulse has been given to prospecting from the quantities of rich ore being shipped from lodes in this neighborhood. There is the Last Chance company, who have continued their work through the Winter, and are now down 175 feet and have commenced to drift on their ledge. They have hauled out to the road about thirty tons of ore in sacks, which will be shipped immediately. The Western Star is also taking out very fine ore. The Eureka, or Green Ledge, have also continued their works during the Winter, and are now down over 100 feet, and have recently shipped twenty tons more of their ore, which is sent to the San Francisco market. This is the second shipment made from this mine, and is only the ore secured from the width of the shaft as they went down. When they get down a sufficient depth to commence to drift out their ledge, they expect to make regular shipments. The Center company on the same lode as the Eureka have gone to work in good earnest, since the value of the vein has been proved by the Eureka company. A small quantity of the ore from this mine has been sent to this city to have its value fully tested.

WASHOE.

The Abel & Key is now in 320 feet with its main tunnel. The rock ahead is getting softer. The superintendent is running for two separate ledges, both of which will soon be reached.

The Express company is running a drift from a 125-foot shaft, from which very fair looking rock is being taken, which will soon be crushed to ascertain its value.

The Globe company are running a drift from a 140-foot shaft, which will strike their ledge 200 feet below the surface and 150 feet from the shaft. They have now about 50 feet to run. Everything about this claim looks substantial. Three shifts are worked.

The Navigation company encounter much water in their mine; and as all their progress is made by blasting it is very troublesome. They are obliged to cover their ca tridges and fuse with wax to render them water proof.

The La Noble company have a tunnel in 460 feet. They are running on the ledge, and expect to get good rock when they arrive at a point under the surface croppings.

The St. Charles struck some very rich rock on the 1st inst, containing blue sulphurets of silver in large quantities. They had recommenced work only a few days previously, after a suspension of operations for several weeks.

Jewett & Shepard.—In our issue of the 28th inst., we noticed the fact that this company had struck their ledge in a drift near the bottom of a 225-foot shaft. Since that time the company has had 6,300 lbs. of the rock crushed, taken unassorted as it came from the lead, with the following result: Gold, $70.31; silver $31.43—total $101.04. They have since got the lead in the bottom of the tunnel, looking still better than in the drift. The superintendent is satisfied that he will soon be taking out paying ore. Rock that will pay as well as the above, as plenty as this company appear to have it, ought soon to make the Jewett & Shepard a dividend paying company.

The Crœsus.—The new 40-horse power engine on this mine, with machinery to correspond, is about or quite ready for operation.

The Esperanza is an incorporated company, the stock of which is confined to but few hands. They have 1400 feet of lode, in the south-east part of Silver City—located in 1860. At that time considerable rock was taken out which paid quite well. Work however was suspended after the first year, until less than one year ago, when it was resumed and has since been carried steadily forward. A tunnel is being run into the ledge, which averages about two feet in thickness. It produces chiefly gold, and is said to pay very well. It is thought that this claim will eventually prove of much value.

The Hall company is located on the west side of Gold Hill. It was first located in 1860; but little work was done upon it, however, until early the present year. The mine is now in a fair way for proper development. It is located in the same hill with the Lucern and Echo. Some very fine looking rock has already been taken out.

The Milton struck their ledge a few days since. It was struck in a drift which runs west 110 feet from the shaft, and at a depth of 350 feet from the surface. The rock is pronounced as decidedly rich. The ledge is well defined and the proprietors are fully satisfied that they have "strack it rich."

The Hale & Norcross, which has just completed a fine building, and other important improvements, are now making preparations to put up two fine engines, one of which will be among the largest in the territory, with a 20-inch cylinder and 4-foot stroke. One will be used for hoisting, the other for prospecting. When all the contemplated improvements are finished, the hoisting works of this company will be equal to any on the Comstock range.

The Chollar found some very rich ore last week, as rich as any ever struck in that mine.

The Bajazet & Golden Era have from 50 to 75 men employed at the mine. The lowest depth yet attained is 260 feet.

The Empire.—Sixty tons of rock from the Empire mine were crushed at the Napa mill, Washoe Valley, and returns made, on the 2d inst, of 128 pounds of bullion.

Peavine District.—The general news from this district is cheering, for, notwithstanding hard times, several companies, including the Monitor, Manhattan, Consolidated Pioneer, American, Mansfield, Katy Watkins and the Star claims, are at work night and day upon their several ledges. The Monitor claim, at a short distance from the surface has a 16-foot vein which, according to Dr. Veach, assays $251 in gold and 100.29 in silver.

The Echo is another claim which has been lying idle for a long time, until within a few weeks. Rock is now being raised from an old incline, which it is confidently expected will pay largely, as it assays from $1,500 to $2,000 to the ton. The lode is several feet thick, the bulk of which is rated as second class; a thin stratum of very rich rock accompanies the main lode, which is being sacked as fast as taken out; eight or ten tons will soon be crushed. Several tons of the 2d class have already been sent to the mill. This mine now stands in a very promising condition, and there is good reason for believing that it will soon become a dividend paying institution.

The Lucern company is now taking out some very good rock from its north shaft. This claim has been worked with varying results for four years, but its works have never gone much below water line. It is thought that when the workmen are down as deep as some of the mines in the same district, it will be found a very rich silver bearing ledge. Explorations thus far show that it improves in value with depth.

Emigrant.—The new shaft of this company is now down 130 feet, from which point they are drifting for the ledge. Several feeders have already been cut. Some good rock has been taken from the old workings, but they were rude works, and it was found necessary to begin in a new place. As soon as the ledge is reached, some rock will be taken out and crushed, after which, if the prospects warrant, work will be steadily prosecuted.

HUMBOLDT.

According to the *Register*, mining interests in this section are looking quite encouraging. No improvement in the price of claims, because of the entire lack of one element to a market—the men with the money to buy; but in each of the old districts are several ledges now in so good a stage of development as to induce the hope that they will soon be regularly sending ore to the mills. The milling interest is far behind. Many claims would be further advanced if the prospect for milling facilities was better. No good has ever been done Humboldt but that accomplished by hard blows.

The Gem of the Sierra, according to the Humboldt *Register*, is being worked with great success. It is not yet fully opened, but is, nevertheless, turning out about five tons of rock a week, which is yielding $300 per ton. An effort was recently made to have the company incorporated in this city; but the Humboldt stockholders, being in a majority, refused. Negotiations are pending to put up a mill in connection with the mine.

The Evening Star is having three tons of ore worked at Fall's mill. It is very rich, and considerable speculation has been indulged as to the return. The ledge is three feet wide, and the metal lying in every part. It is considered a very valuable claim, and would probably bring a high price were it in the immediate vicinity of a mill.

Fine Ore has been shown from the claims of the Detroit and Arizona. The Jackson Company finds the ledge gradually improving, and the boys say they will give as good accounts, from ore now assorting for the mill, as have been got from anything at their depth.

Santa Clara.—Work still progresses in the tunnels of the Little Giant, Magna Charta, and Butte Companies—workmen on day and night. Contractors have completed their work in the Miama and Wyoming claims, and new contracts will soon be let.

Manitowoc is improving in appearance—quartz coming in in considerable veins. The Buena Vista Company have found a capital prospect 150 down in the Rising Sun ledge. As fine a show of metal as any ledge in the district. Anderson is 150 feet down in the new incline shaft, with a well-defined ledge three feet wide the whole depth, and quartz now improving in quality. The Arizona is doing good work now, running night and day. Ledge well-defined, and containing very fine ore.

REESE RIVER.

The Reese River *Reveille* claims that the general dearth of business in that section is partially caused by the awkward situations of the mills there and thereabouts. It says: "The most casual observer will notice the inconvenience of every arrangement as they are at present. The cañon where the mills are situated is very narrow and steep, rendering it difficult for wagons loaded with ore to approach or depart; cramping up the machinery, leaving no place for ore houses, roasting furnaces, boarding houses, offices or any other building requisite to carry on so great a business." The same paper states that pack trains are bringing in large quantities of salt from Humboldt, and that great quantities are stored in Austin.

The Rough and Ready Lode.—The *Reveille* states that selling rates of this stock, within the past two months, have gone up from $10 to $100, and back again. That paper is at a loss to account for this fluctuation, inasmuch as few claims in the Territory can show better rock, or that which is more easily got at. Crushings have been made at different mills, and invariably at paying rates. An incline is now being sunk on the lode. Workmen are down twenty-five feet, and the rock looks better than any taken from the surface.

Savage.—Three tons of rock from the Savage claim have been crushed, with a result a fraction short of $1,200 to the ton, according to the *Reveille*.

The Amador Lode.—The Company has stopped taking out rock at the surface, but are pushing their tunnel ahead. They are now in upwards of 600 feet. Some 200 tons of rock are lying at their surface workings, waiting to be hauled to the mill. The ore is said to be of a very superior quality, showing a great deal of horn silver, chlorides and sulphurets.—It is estimated that should this be worked it would return all the money that the company has expended in all its works. It has all been taken out within a few feet of the surface.

Maggie Lode.—Some fine developments have recently been made at this mine. The *Reveille* says: "From a depth of twenty feet below the level of the tunnel, drifts have been run each way, near 60 feet, finding in these some of the richest ore ever brought to light. We have seen large pieces of antimonial ore of great beauty, and which were considered worth fully five dollars per pound." Much fluctuation has been produced in the price of this stock by the efforts of speculators.

Important Discovery, if True.—George Laid, of New Almaden, in this State, writes to the Reese River *Reveille*, stating that he has discovered a substitute for blasting powder, less dangerous and much cheaper, which can be made by any miner, at cost of but two dollars and a half per keg. Mr. Laid says that it is a chemical compound mixed with sawdust, that a man can make twenty-five kegs per day in a common stove boiler, and adds that he is now using it with great success in the New Almaden mines.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

Removal.—D. S. Cutter, has moved his Mining Secretary Office to Room 28, Government House, where, in his absence, Brock Johnson will attend to business for him. 23 1m

Legal Tender Notes.

San Francisco, Friday, June 3.....55¼ per cent.

Mills for Union District.—Arrangements are being made in this city for the erection of two or three mills at Ione City, N. T. Some of the Washoe capitalists have been quietly securing man of the most valuable feet in Union district. Hence the movement for the erection of mills. Ione City will soon become an important mining center.

[Written for the Mining and Scientific Press.]

From Catalina Island.

Editors Press:—Herewith I send you a brief statement of some of the mining operations on this isle:—

Gem of the Ocean.—Work on this mine is prosecuted more vigorously than ever. Tons of fine silver ore are taken out daily, and the mine has established an excellent reputation.

Vancouver.—Still improving; ledge about four feet wide, almost solid; mineral well cased, quite hard, and scarcely a piece is picked up that is not mineral.

Argentine have also struck a good ledge which bids fair to be equal to the best.

In fact rich strikes are coming in on us so fast it is impossible to keep track of them.

Wellington Copper Mine.—A Strike of Silver.—Work is more energetically pushed forward on this mine than ever. The boys are in the best possible spirits. Mr. Vansickel, one of the proprietors, showed us a specimen of ore taken out only twenty-five feet from the surface, which contains a large quautity of black sulphurets of silver, which by acid test (our only way of judging here) is immensely rich in silver. This is as yet the largest ledge on the island; the lode at present about 12 feet wide—mostly containing flattering indications.

The Occidental are taking out very fine mineral, and recent assays prove it to be rich in silver.

The mines of this island have just passed through the trying ordeal which awaits all new mining regions, and having proved their stability and ability to make good returns, capitalists are freely investing, which is a strong indication of mineral wealth.

A.

Santa Catalina Island, May, 20th, 1864.

Discovery.—Workmen engaged on a mine near the Spring Creek quartz mill, Shasta county, have discovered a substance similar to that elsewhere noticed in our columns, to day, as in all probability Fuller's earth.

Bullion from Washoe.—The amount of hullion shipped from Virginia City for the week ending Friday May 3d was $245,334.

Resigned.—R. F. Morrow has resigned the superintendency of the Savage Mining Company.

Treasure.—Up to the present date, $6,305,136 39 more of treasure have been shipped from this State than was shipped up to the same time last year.

Aurora Bullion.—The amount of bullion shipped rom Aurora, through Wells, Fargo & Co, during the month of May was $118,500.

San Francisco:

Saturday Morning, June 11, 1864.

Another Enlargement.

With the close of the present month terminates Volume VIII. of the MINING AND SCIENTIFIC PRESS. With the commencement of the next Volume, the publishers have determined to permanently enlarge the pages of the sheet from three to four columns, a size but a trifle smaller than that of the London *Mining Journal*, the largest *mining* paper in the world. Our success during the present volume permits us to assure our readers of the permanent improvement and progress in usefulness of our journal.

June 1st, 1864. DEWEY & CO., PUBLISHERS.

MINING SHARE MARKET.

The Mining Share Market has presented a more cheering aspect during the past two days, and a renewed confidence is evidently gaining ground. The receipts from the interior have not for a long time been better. Large orders have been received by telegraph within a few days, for investment on eastern account, and many parties who were anxious a few days since to become sellers, have now withdrawn from the market. Notwithstanding the great depression which has been encountered during the past two or three weeks, confidence in the ultimate value of our mining interests is still unshaken. The panic through which we have just passed will not be without its beneficial effects. It will prove, to a great extent, a pretty effectual check upon mere speculative enterprise, and teach the great mass of buyers to be more cautious in their future speculations. It has already done much toward impressing upon the public mind the importance of more economy in mining operations, and the absolute necessity of intrusting their interests to men of undoubted integrity. Parties who have invested with judgment and discretion, have no cause for uneasiness. Our mines were never yielding better returns; dividend paying companies are constantly increasing, and the continuance of dividends already initiated are, as a general thing beyond contingency. The sales of the past week exhibit a most gratifying improvement over those for several weeks previous. They foot up at the very respectable figure of $1,313,664. More than double the sales of last week.

Ophir still continues quite active, but at fluctuating rates. This stock opened on Monday at $675, dropped to $600 on Tuesday, rallied to $900@980 on Thursday, and again dropped to $880 before yesterday's Board. Fifty-four feet have changed hands at from $600@980.

Gould & Curry has been unusually active, at greatly fluctuating rates; 194 feet have changed hands since our last report, at from $2,400@3,325, closing before last evening's Board at $3,120.

Savage, after finding a seller at $1,400 on Tuesday and $1,500 on Wednesday, advanced to $1,750@1,800 before yesterday's board. This company did not declare a dividend for May; although the receipts for the month were about $100,000.

North Potosi has been more active; 200 shares having changed hands at about previous rates—from $70@80.

Chollar has met with a fair, but somewhat fluctuating business, ranging from $500@630, closing at $565. It is reported that some very rich rock has been struck at the mine during the past week, and that appearances indicate the immediate presence of a large chimney of ore.

Burning Moscow has been less active; it has still further receded and may now be quoted at $44.

Blue Ledge has met with a large business at an important decline. Opening the week at its usual figure it rapidly fell to $8¼@8, nearly 400 shares having changed hands at those figures yesterday.

Golden Age & Empire has been in considerable demand and at materially improved rates. This is now one of the most promising mines in Esmeralda A remark, intended for the Pride of the West, was inadvertently appended to our last week's notice of this company.

The Belcher, Baldwin & Abernethy have declared a dividend of $7 per foot, each, for the month of May, or $21 per foot on the consolidated interest, payable on the 10th instant, at the company's office in Virginia City, N. T. No transaction in this stock has been noted the past week.

The Empire Mill and Mining company have declared a dividend of $30 per share for the month of May.

Lady Bryan has fully maintained its last week's figures with a very large business; 2,710 shares have changed hands at from $26@32, closing at 30. Favorable accounts are still received from the mine.

North American, which had rallied materially on Saturday last, touching $140, dropped on Thursday to $107, but rallied again yesterday to $130. A large business has been done in this stock—1,041 shares having changed hands.

Bullion, G. H., has sold at from $65@70; Daney at $70; Nevada, J. G., dropped from $45@30; Yellow Jacket has been heard from at $950; Uncle Sam at $700; Baltic at $70; Hale & Norcross at $550; Independent at $130; Sierra Nevada from $35@40.

Mount Davidson has again come into notice, in consequence of a reported strike of considerable importance. It has advanced from $1@3¾.

Real del Monte has met with quite a uniform business at from $37½@42½, opening and closing the week at the former figure. Very favorable accounts are received from the mine. A remittance of $13,500 in bullion was received in this city on Friday of last week.

For additional quotations we refer our readers to our tabulated statement of the business of the week.

WASHOE STOCK MARKET.

Review of the Week Ending June 7th, 1864.

The Washoe Stock Market has been almost at a stand still since our last dates. Very little stock is being offered; buyers are few and will negotiate only at greatly depreciated prices.

Jewett & Shepard opened at $17½@$28; dropped the next day to $15 cash, $22½, buyer 30 days; and closed on Tuesday last at $13¾.

The entire business has been as follows: Jewett and Shepard, 85 shares at $13½@18 cash and $22½ buyer 30 days; Lady Bryan, No. 2, 30 shares at $1¼; Baltimore American, 5 shares at $46, and 2 at $35; Pioneer Commercial, 20 at $1¼; Sutro, 30 at $2 and 35 at $3; McDermott, 10 at $7; Harold & Argo, 15 at $1; La Plata Oro, 24 at $6½; Branch mint, 10 at $30, buyer 30; Crescent, 10 at $5½, and 40 at $4½; Randolph, 27 at $7½, and 25 at $7.

Election of Officers.

The following companies at their meetings during the past week have elected their officers as follows:

LA MARRONENA.—Meeting, Wednesday, June 8th; Trustees for the ensuing year, J. O. Eldrige, Wm. Faulkner, A. J. Ralston, Thomas J. Haynes and D. S. Lord. At a subsequent meeting of the Trustees, J. O. Eldrige was elected President and Geo. L. Faulkner, Secretary.

PENA.—Meeting, June 8th; Trustees, D. S. Lord, Wm Faulkner, J. W. Sargeant, A. J. Ralston and W. H. Baxter. At the Trustees' meeting, D. S. Lord was elected President and Geo. L. Faulkner, Secretory.

CROWN LEAD.—Election held June 7th; Trustees, F. A. MacCrellish, M. M. Noah, A. Austin, A. Rosenfield. The Trustees subsequently elected H. A. Cobb, President, W. S. McKenzie, Superintendent, and J. W. Gould, Secretary.

MR. R. C. GRINLEY, of the Sanitary sack of flour, has returned to Reese River, being recalled by sickness in his family. In the meantime it is presumed the famous sack will still go "marching on."

[Written for the Mining and Scientific Press.]

Letter From Owensville.

MESSRS. EDITORS:—Owing to constant employment, almost night and day, for the last five or six weeks, I have been unable to keep up my regular correspondence with your valuable journal—valuable indeed to me, as it is the only paper that has reached me since I took up my abode in this place; and even now my time is so limited that I must be brief.

There have been some valuable discoveries made in Montgomery and Silver Mountain districts since I last wrote you, and claims that were then located have, upon being prospected, proved rich beyond the expectations of their owners. Among those that have paid so well are the Crockett, Pine Leaf, Aristides, Emma Hardinge (what's in a name?) Plymouth rock, and several others, which I will mention in my next. An assay was made from the Pine Leaf, the other day, which showed $6,742 per ton! The ledge is about twelve feet wide, and the rich streak running through it, from which the assay was made, is two feet wide. In my opinion, when the mine is properly opened, it will be one of the most valuable mines on this coast. The Aristides is a very fine gold ledge, in the same district, and so equally distributed is it throughout the rock, that almost every piece as large as a hen's egg shows the metal. Mr. Smith, one of the owners, has sent some specimens to your city, which you can examine by calling on Mr. B. M. Barker, No. 622 Montgomery street.

I would like to mention more of the late discoveries, but time will not permit. Suffice it to say, that we have got the gold and silver country, climate and everything that a people could ask for, except money. That is what is needed now to develop both our mining and agricultural resources. And when that arrives, which it certainly will, you will see one of the richest countries that has ever been discovered. Our town is growing rapidly, and in a short time we shall be independent of all the rest of mankind. Come down and see us then, will you? More anon. VERELAN.

OWENSVILLE, June 2d, 1864.

THE GOLDEN AGE AND EMPIRE.—This is one of the most promising mines in Esmeralda, and is situated on Last Chance Hill. The two companies, the Golden Age and the Empire, were first located in 1860. They were consolidated in March last.—About 1,000 tons of rock were taken out and crushed in 1860 and 1861, yielding at paying rates. The present Superintendent, Mr. Benson, went to work with a few men last December, and in about two months sent down $5,000. A subsequent crushing of 214 tons yielded $35,500, which was received in this city some three or four weeks since. One dividend, of $5 to the foot, has already been paid, and the funds are now in hand for the second. Three dollars per foot is the total amount of assessments levied by this company to date, only $1 of which has been made since the consolidation. The mine has recently been examined by Professor Silliman, who speaks well of it. The deepest shaft yet sunk is 140 feet. Better rock is confidently expected at a lower point. The Company is now taking out rock which is being crushed, from which another remittance will soon be received.

STRIKE.—Mr. Cougdon, Secretary of the Prima Donna Mining Company, located in Devil's Gate District, N. T., has shown us some very fine looking rock recently taken from that company's mine. The strike was made in a drift which had been run 58 feet from a 152-foot shaft, striking the ledge at that point. The rock bears a most striking resemblance to Comstock rock.

"LEAD MINES."—In our item under this heading last week, "N. T." was incorrectly inserted after "Virginia." We did not write it there. Gold Hill *Daily Message* will please take notice.

"SOAP MINES"—FULLER'S EARTH?

During the last few years we have frequently observed in our exchanges notices of the discovery of a peculiar description of mineral to the locality of which the term "soap mine" has generally been applied. The latest discovery of this character is on the American Flat, near Virginia City, N. T. It is found lying adjacent to the lode in the Real del Oro mine, and about sixty feet from the surface. It is described as consisting of a soapy kind of clay, much resembling castile soap, readily forming a lather, and by which dirt may be easily removed from the person or from cloth.

This material is evidently a species of clay, known as Fuller's earth, the ingredients of which are usually about 53 per cent. of silica, 25 per cent. of alumina, 15.5 per cent. water, with 3.5 carbonate of lime, 2 oxide of iron, and 1 per cent. of carbonate of magnesia. This clay is grensy to the touch, shining under a slight friction, crumbles in the open air, melts before the blow-pipe into a white glass; when immersed in water it falls into a soft, pasty substance; color, brown or grey, generally with a shade of green; does not adhere to the tongue. From the great avidity with which it absorbs oil, it has been extensively used by fullers to take grease out of cloth. Its use, however, in this direction, has of late years been greatly lessened by chemical preparations. This material is a far better cleanser than ordinary soap, but produces the reverse effect in felting, as it leaves the pores of the wool and thread more open than before it was used.

Fuller's earth, of good quality, has hitherto been a very rare mineral. More has heretofore been found in England than in all the other parts of the world. It occurs there in regular beds. It has been found, in small quantities, at Rosswein, in Saxony. Some thirty-five years since an article was carefully prepared and widely circulated in the Eastern papers, describing Fuller's earth requesting that samples bearing a resemblance to the description should be forwarded to the writer. Out of about one hundred samples sent, only one, from Virginia, proved to contain Fuller's earth, and that was so full of sand and gravel as to render it worthless. The advertiser had previously heard that it was to be found in a certain locality in Rhode Island, and spent several days in a fruitless search for it. We have been unable to learn that the mineral has ever been found on this continent, unless it exists in more recent discoveries in this State and Nevada Territory, above alluded to. We believe that our market has been supplied altogether from England.

Prof. Wm. P. Blake is now engaged by the "Scott & Perigord Tunnel Company" in making a scientific survey of the Humboldt range of mountains—especially the section through which the tunnel is being run—with regard to its mineral-bearing qualities; also, to report on the feasibility of working those mines. As data on that subject, he has made the preliminary survey of a railroad to run from the big bend in the Truckee river—about forty miles from Virginia—to a point on the west side of the Humboldt range, the whole distance being about 85 miles, and quite practicable for the easy construction of a road. Such a road would transmit ores to the Truckee, where there are some of the best facilities for the application of water power in the world, and an everlasting supply of fuel, which will be brought to the mills at a nominal price.

The Oakland Railroad has already been extended as far as Clinton, to which point the cars will shortly commence running. The road will soon be pushed on through the Alameda valley.

From Idaho.—The Humboldt *Register* says that quite a number of persons have recently returned to Star City from Boise River and Jordan Creek.—They do not give a very flattering account of that region as a mining country.

About the "Formation of Metallic Veins."—Messrs. Editors: In the series of articles on "The Formation of Metallic Veins" there occur a few typographical errors, some too apparent to need correction, and others materially affecting the sense of the ideas to be conveyed. Of the latter class, in No. 1, paragraph seventh, for "such as magnesia," read "such as manganese;" in paragraph eleventh, for "fluor spar," read "fluoriae." No. 3, paragraph first, for "stratic limestones," read "steatic limestones;" paragraph second, for "the writer holds the system," read "the writer holds that the system." No. 4, paragraph seventh, for "and consequently black as sand," read "and consequently black, as sand," the comma having been omitted.

In noticing Mr. Fox's theory of fissures, I wrote from mere remembrance, and unintentionally confounded his experimental production of veins with his observation on the fissures containing the veins of Cornwall. On re-perusal I find that he ascribed the production of the latter to the internal heat of the earth (of which he was a strenuous advocate), posterior to and independent of the eruptive disturbances attendant upon the uplift of the granite and the intrusion of the elvan dykes. Against the general reception of this theory my remarks are equally applicable.

I will here state what I failed to explicitly explain, that I do not believe that more than a few fissures *necessarily remained open until filled with vein-stone*, but that the mechanical fracture, *however slight or prolonged the parting*, produced perpetual lines of division in the strata and masses of rock, which by readily admitting the flow of water and interruptiag the electrical currents, accumulated veins and their metallic contents. The best veins in our State are between the natural divisions of different geological strata, where there never could have been a coalescence. In Washoe many fissures appear to have been produced beneath the ocean and immediately filled to a certain depth with calcareous material, within which veinstone of quartz has since been eliminated from the surrounding rock. In this respect they resemble the veins upon which Werner founded his theory of the sedimentary origin of all veins.

Edward A. Miles.

The Patio Process at the Gould and Curry and Ophir Reduction Works.—The *Territorial Enterprise* of May 27th says:

The Gould and Curry Company are about to change the process of reduction in their mill from the dry to the wet method. The dry mode is very hard on the lungs of the workmen, and is no more economical than the wet plan. They are now engaged in the erection of six large patio platforms, to be used in working the tailings from the mill. The amalgamation will be effected in the tortas without the aid of the wooden wheels commonly used, a number of Mexican mustangs having been procured to be used in treading the pulp. This plan of working silver ore is practised in Mexico, but is very hard on the poor animals, as, owing to the chemicals used in the pulp, their legs are liable to become very sore, and the mercury in the mass is also injurious to their health.

The Ophir Company are also increasing their employment of this method for poor ores.

The series of articles which we are now publishing on the Patio process will, we trust, clear up some points to which less attention has been given by many practical amalgamators than may be required. Those who are adapting this process to pan amalgamation will see much of interest to them carefully traced in this summary of the observations of their fellow-workers in other countries. The waste to which their chemicals are exposed—the action of light and heat—the effect of one ore on another when subject to attrition together—are of importance. Especial notice is drawn to the essential difference between these methods and the principle of treating a uniform product aimed at in the latest European improvements.

The Reese River Reveille now comes to us daily instead of weekly as heretofore. Wm. C. Philips, the former proprietor, has sold out to Fairchild & Co. The paper makes a decidedly good appearance in both matter and manner, and must take a high stand among the dailies of Silverland.

Mariposa Company.

The Mariposa Company, lately formed in New York, have purchased the interest of Mark Brumagim and Trenor W. Park in the estate known as "Las Mariposas," or, in plain English, "The Butterflies," and as some names now prominently before our readers will appear during the recital, we consider this as good an opportunity as any to give a brief

HISTORY OF "LAS MARIPOSAS."

This celebrated tract of land was originally owned under a grant from the Mexican Government to Juan B. Alvarado, and was by him sold to John C. Fremont, and after a time re-sold under a judgment recovered by Francisco O. Campo against J. C. Fremont and other parties, through which sale the interest of Messrs. Brumagim and Garrison in the estate came, and finally passed into the hands of "The Mariposa Company," which company, (organized and incorporated under the laws of the State of New York,) either forgetting, or being wilfully blind to, entirely ignored the claims of Messrs. Brumagim & Garrison; but these gentlemen, not being either blind to their own interests or forgetful of their claims for moneys actually advanced to Messrs. J. C. Fremont and T. W. Park, offered to the new company a chance to purchase from them all their interest in "Las Mariposas" for the sum of (in round figures) $1.75,000. This offer the company indignantly refused, and as Messrs. Brumagim and Garrison were cool, clear-headed business men, they immediately proceeded to commence operations to enforce their claim; and, having first obtained an extensive and thorough abstract of their title, proceeded to institute legal proceedings for the sums advanced and interest thereon. The New York Company, finding that they had found parties who would not be scared, and believing that discretion was the better part of valor, offered, like Captain Scott's celebrated coon, to "come down," and were finally allowed to do so to the amount of $350,-000 in gold coin. The result is gratifying all round, as the sellers are amply recompensed, and at last the Mariposa Company of New York have obtained an absolutely perfect title to the grant whose name heads this article.

"Mount Eden Mining Company," Gold Hill, N. T.—The above named company recently filed a certificate in the County Court reducing their Capital Stock from $600,000 to $360,000, and increasing the number of shares from 1,200 to 1,800, an addition of 600 feet of ground having been added to the claim. This company was originally started as a prospecting company, and afterwards made the location now known as the Owen lode, at Gold Hill, which from the surface made a most excellent showing. The entire ledge, for twenty feet deep, was taken out and put aside for selecting and working at some future day. The Superintendent has followed down an incline on the foot wall for 110 feet in depth, occasionally tapping the ledge to ascertain its value. It has also been traced down the hill toward the ravine, showing that drainage can be had some 800 feet deep from the top of the present shaft by running a tunnel. This ledge is doubtless on the Justis lode, and is known to be at least ten feet in width. The Superintendent, F. Morgan, would be pleased to show any party through the mine, who desire to examine the same, and will give them all required information. Thus far everything done has been with the strictest regard to economy, and the mine promises soon to rank among the best in the Territory. We understand the President, Mr. W. Augs. Knapp, goes to New York on the next steamer, on Monday, for the purpose of endeavoring to invite Eastern capitalists to investigate and become interested in the Company.

Patriotic Stockholders.—As will be seen by our Shareholders' Directory, quite a number of companies announce their annual meeting on the Fourth of July.

Mechanical Department.

Report of the Commissioner of Patents.—We have received a copy of the preliminary or introductory Report of the Commissioner of Patents, (Hon. D. P. Holloway) for 1863, which has just been issued from the press. This report is embraced in a pamphlet of forty-eight pages, giving a brief statement of the financial condition of the Department, a somewhat full argument in defence of the patent system, or policy of granting protection by patents, and a review of the progress of the arts in this country during the last two years. We shall present some interesting extracts from the report in future numbers of the Press and condense and collate whatever we may deem of especial value to our readers. The industry and talent displayed in the preparation of this document is highly creditable to the Department, and presents a most encouraging record of the progress of the mechanical arts, in this country, during a period of political and social disturbance, which one would naturally suppose would have tested our entire energies to their utmost extent, to efforts far from pacific and progressive. So far has this however been from the actual fact, that the patents granted during the year just passed have been equalled in only two former years of our history—and this too, it should be borne in mind has been effected within the geographical limits of only one half of our original territory.

American Steel Manufacture.—The manufacture of steel is comparatively new in America; yet, although it has hardly passed beyond mere experimental operations, it has, nevertheless, thus far proved a complete success. Labor in steel, as in iron, constitutes a large item in the cost of its manufacture, and the lack of skilled hands, of course, has a tendency to run up the price of labor. The late advance in the price of this material, however, has enabled some of our most enterprising iron workers at the East to overcome all obstacles, and to build up what will undoubtedly prove permanent establishments in this important branch of industry. Six large mills are now at work in Pittsburg, with the most encouraging success; and among them are produced all the different varieties of steel found in the market. Before there can, by any possibility, be any material reduction in the price of the manufactured article, the country will be so abundantly supplied with skilled labor as to render the permanence of this new industry a matter beyond a doubt. The Pittsburg works, at the present time, are pressed to their utmost capacity to supply orders.

Large Freight Wagon.—Mr. Paul Wehber, of Marysville, has recently built a mammoth freight wagon, capable of carrying about *twelve tons* of freight. The wagon weighs nearly three tons, and has been built for Mr. William Johnson, who will employ it in the Washoe trade over the Henness Pass road. This is the second wagon of this description which has been built at his shop.

The Steel Shirt Collar is one of the inventions of the day. The collar consists of a single strip of tempered steel, painted, varnished and indented about the edge, in imitation of stitching. It is so constructed that it can be worn either as a "turn-down" or "stand-up" collar. It is fastened, by rubber loops, to the buttons on the neck-band of the shirt.

Testing Bridges.—In a recent case with regard to a bridge, an expert very correctly testified that a measured march of men was the severest test of a bridge, and that the trotting of a horse produced double the vibration of a twelve or fourteen-ton locomotive.

The Nashua Lock Company in New Hampshire makes one hundred and twenty-five different styles of locks and latches. It is the oldest manufactory of the kind in the country, having been established in 1832.

Another Monster Cannon has been successfully cast at the Fort Pitt Foundry, Pittsburg. This last gun is intended for sea service, and is somewhat lighter than the first, although its bore is 22 inches instead of 20. Says the local paper:

This gun, like its companion, was cast upon the Rodney principle, with a hollow core. It may not be uninteresting to give the time in which it was cast. There were four furnaces (3, 4, 5 and 6) charged at 4 o'clock and 15 minutes yesterday morning. No. 4 was ready for tapping at 17 minutes past 11 o'clock; No. 5 at 55 minutes past 10 o'clock, and No. 6 at 45 minutes past 10 o'clock. No. 3 was held in reserve to meet any accident which might possibly occur in the process of casting the gun. At precisely 12 o'clock 51 minutes and 30 seconds, the molten metal was released from its confinement in the furnaces and rushed hissing and seething along the channels which conveyed it to the mold, and in 22 minutes and 52 seconds the undertaking was accomplished, without the slightest untoward incident. Indeed, so complete are the arrangements for casting guns at this establishment, that those who immediately superintend the operation seem scarcely to realize the magnitude of the undertaking, believing that a 20-inch gun can be cast as perfect as the smallest piece of metal machinery.

The 20-inch gun is fast approaching completion, and its complete success is confidently predicted. Thus far, not the slightest flaw has been discovered in the metal. At the last casting, two foreign military engineers were present—officers of the English Royal Artillery. Both these officers have been sent by the English Government to visit our arsenals, navy yards, gun-casting foundries, etc., to observe the improvements we are introducing, and report upon the same. Our English cousins are waking up to the fact that we really are making some progress in military engineering, and appear to be quite ready to take advantage of the same. The London *Times*, in a late allusion to the casting of the 20-inch gun, remarks that, "In the caliber of its ordnance, Europe is now, as it has ever been, far behind America."

New Fire-Proof Armor.—A simple, and said to be an effective apparatus, has been lately constructed by a Mr. Kuhfuss, of Carlsruhe, for the purpose of discovering the whereabouts of the flames in cases where the smoke would prevent a fireman from entering a house in the ordinary manner. Mr. Kuhfuss does away with the mouth-piece and fresh-air pipe hitherto used in these cases. The apparatus consists of a cap made of light material, and covered with a coating of gutta-percha; this cap is drawn over the head, a collar of India-rubber fitting it sufficiently tight round the neck to prevent the smoke from entering. Two holes, filled in with glass, admit light, as in a diving apparatus; and in the region of the mouth and nose two cross incisions are made, which are buttoned up, after a sponge, saturated with strong vinegar, has been admitted, entirely covering mouth and nostrils. Experience teaches that the organs of respiration are not affected by the smoke so long as the sponge is kept wet; and a small bottle of vinegar which the fireman takes with him, enables him to moisten the sponge when required. A whistle, attached to the inside of the cap, completes this very simple contrivance.

A New Compass for the mariners' use has lately been devised, combining many advantages over those previously in use. The inventor is L. G. Vassallo, late of the Austrian navy, but now an officer in the service of the United States. The improvement consists in having engraved upon the glass cover of the ordinary compass a universal sun dial—*i. e.*, the hours of apparent time are engraved upon the compass cover. The arm of the sun dial is erected from the center of the compass cover, and is so hinged at this point as to be moveable at its upper extremity. The arm moves along a graduated arc, thus indicating the latitude. Now, by means of apparent time and latitude, the true meridian can be determined, and this will indicate upon the magnetic card the combined variation and deviation of the compass for the course at the time of observation.

Large Planer.—The Sacramento Iron Works are putting into their shop a large iron planing machine—the largest in the State. It was manufactured by Bennett & Dougherty, of Philadelphia, is capable of planing a piece of metal 20 feet long and 6 feet square, and weighs 27½ tons. The entire machine will be here on Monday. An extremely solid foundation of brick has been laid for its accommodation.

Why Are Carriage Wheels Made Dishing?—Mr. S. E. Todd, writes to the *American Agriculturalist*, proposing and answering the above question as follows:—

Many farmers and good mechanics ask *why carriage wheels are made dishing?* Wheels are made dishing that they may endure the greatest strain under all ordinary circumstances, where great strength of wheels is very essential; and also, for the purpose of making small spokes endure as much strain as large and heavier ones would, were the wheel not made dishing. If a wheel were always to bear a load on a track level from side to side, the *strongest possible form* that a wheel could receive, would be, what we term "straight"—not dishing. But, since carriages must bear loads along slopes and sideling tracks (and must make sudden turns,) as on level roads, the wheels must be made a little dishing. Let us suppose a straight wheel placed resting on one end of the hub, and heavy weights resting on the rim, the spokes would be easily broken at the hub. But, if a dishing wheel of the same strength of timber be placed resting on the large end of the hub, it would very obviously sustain a very much heavier weight without injury. Now, when a wheel of a carriage drops into a rut or hole, or when the carriage is rolling along a steep slope, the greatest weight, as well as the greatest strain, will fall upon those wheels that are in the lowest position. If they are made dishing, the spokes will stand in a *bracing position*, and those wheels will endure a great strain; and, unless the tire should burst—as there is a great strain in that direction—the wheel will sustain no injury, although the strain might be sufficient to crush a straight wheel almost instantaneously, when in that position.

Alto Relievo, or High Relief.—A term used in sculpture or architecture to denote a figure or figures drawn from life, and projecting so far out from the stone or metal on which they are sculptured as to represent the full and natural size of the original body. The same term is sometimes applied to paintings, when they are very boldly executed, and the figures apparently stand out from the canvass. Origin: It will be remembered that in early times we derived our principal knowledge of the fine arts from Italy, and, as our ideas were chiefly borrowed from the Italians, we adopted their terms. *Alto Relievo*, was a term originally used by them, and consisted of two Italian words, literally meaning, "raised high."

New Method of Locomotion, Perhaps.—An English paper states that a new method of locomotion has been devised, by which a speed of six miles a minute is obtained, and capitalists are besieging the British Government to allow them to construct lines for passengers and traffic through all parts of London. The London *Examiner* exclaims on this: "Happy, although unconscious posterity! We envy you; we must crawl through life at the snail's pace of only a mile in two minutes, oftentimes less, while for you awaits the ecstatic bliss of being shot through space at the rate of 360 miles per hour."

Another Substitute for Gunpowder.—Dr. Paul Swift, of Haverford College, Pennsylvania, lately, discovered that sulphureted hydrogen in carbon, forms a very explosive compound, it having blown a hole through a thick oaken bench, upon which the first experiment was tried. The carbon being placed under a receiver imbibes from 90 to 100 times its bulk of sulphureted hydrogen, and becomes very explosive. The doctor, aided by Dr. Robert Chase, of New York, is now pursuing a course of experiments which have thus far been eminently successful. They are confident of having found a substitute for gunpowder, which can be manufactured at less than half the cost of the article now in use.

A young man who was carried fifteen or twenty times around a shaft in Taylor's soap-stone works at Perkinsville, Vt., the other day, had every article of his clothing torn from him, but escaped without a scratch upon his person.

The first locomotive engine was landed last month at Ceylon from the ship Palmerston. It was landed on a bamboo raft, and was to be drawn to the railway station by a team of three elephants.

Mountain Mahogany.—This hard and heavy wood grows in great abundance on the summits of the mountains around Markleeville. Those who have worked it, think it will make very fine veneering.

A Steam Engine of 40-horse power is to be set up in the Gould & Curry mine over 400 feet below the surface of the earth. Its labor will be to hoist water and ore from a still lower depth.

A Practical Invention.—We have been shown a new-fangled rat-trap, invented by a citizen of Sacramento, which beats anything we ever saw or heard of for exterminating long-tailed vermin. The trap shown us is constructed of wire, and in length is about twenty inches, and is divided into three separate rooms. The first room is the reception room, in which the alluring bait is suspended, but never disturbed, for his ratship has something else to think of. The scent of the cheese allures the rat into the front door, and before his caudal appendage is fairly inside, his weight upon a false floor in the bottom of the trap causes a lever or beam on the top of the cage to tilt, and in a trice the front door is closed, and by the same action, that leading to room No. 2 is opened. Having entered the next room, he there steps upon a false floor, which operates as in the first apartment, and shuts the door behind him, and at the same time opens the front door all ready for another rat. The baited rat having been shut into the second room, finds only one chance to get ont, which he immediately proposes to do by raising a little door that lays in an angular position, and which fastens him into room No. 3. The trap is continually set, and from actual experience it has proven its entire practicability and usefulness, one night having caught eleven and other nights catching four, five and six at a time. The inventor has applied for a patent, and they will soon be offered for sale.—*Sacramento Star.*

Electro-Motive Engines.—Messrs. Storer and Hancock, of Nottingham, have provisionally specified an invention, which consists in thus constructing electro-motive engines:—In a suitable frame they fix a ring of magnets, which are charged with electricity, from a battery in the usual manner, and inside this ring of magnets is fixed a circular rack or wheel with internal teeth. Upon a central shaft, to which rotary motion is to be communicated, they fix four or more arms, each of which carries a wheel with six armatures, more or less, free to revolve upon an axis, and upon this axis there is also a toothed pinion gearing into the circular rack. Upon the current being applied to the magnets in proper order the armatures are attracted, revolve on their axis, and carry round the arms and shaft to which they are connected. Power for any purpose required may be taken from this shaft. In some cases they keep the arms carrying the armatures stationary, and drive round the circular rack or wheel, and take the power from it.

A New Motive Power has been invented by Profs. Branstrand Mattencei, of Florence. The engine may be described as atmospheric, a vacuum being produced in the cylinders, under the pistons, by the explosion of a mixture of atmospheric air with an inflammable gas. The explosion is said to be without noise and free from danger. The consumption of gas used is one third of a cubic metre per horse-power per hour. The gas is said to be produced at a cost of less than a penny the cubic metre; consequently a horse-power can be obtained at about one-third of a penny the hour. The machines constructed are reported to work satisfactorily, and the principle to be equally applicable to marine and locomotive engines.

American Fish-hooks.—Fish-hooks have hitherto been chiefly made in Europe, and mostly by hand. A New Haven (Conn.) mechanic has recently invented a machine, which, according to an Eastern paper, "chews up steel wire into all sizes of hooks, and spits them out as fast and as perfect as a pin-machine."

Tinted Cheeks.—A curious work on cosmetics, recently published, strongly condemns rogue and pearl powder, but informs the ladies how they may give color to their cheeks without danger. Thus: "Take a fragment of bright crimson silk, dip it in strong spirits of wine, and rub it over the cheeks till a moderate tint appears. This defies detection and is harmless."

The Folsom *Telegraph* says that the Folsom Granite Flouring Mills are the most extensive in the State, employing about thirty hands, and turning out over 700 barrels per day.

A Car Buffer is in use on the Midland Great Western Railway, which, placed on the rails, will bring up a heavily loaded train going at the rate of twenty miles an hour, in a space of nine feet, without injury to the cars.

San Jose Railroad.—This road is in a flourishing condition, and its business is steadily increasing. The receipts, thus far, have been as follows: January, $15,495; February, $22,966; March, $25,120; April, $29,627; May, $38,349.

Suggestions About Advertising.

Advertising at the Mines.—Companies whose notices are required to be published in the county in which the mine is located, should be careful to have their advertisements forwarded in season.

No Assessments should be levied upon Friday where the publication is to be made in the issue of a paper published on Saturdays only, at the mine or elsewhere.

On Record.—As a large proportion of our edition will be bound and preserved in volumes, those who patronize our columns will have their advertisements preserved with a valuable record.

For Serving Personal Notices.—Secretaries patronizing the Press can have their advertisements neatly printed upon slips at $1 per hundred.

Advertising Blanks for Secretaries who design publishing notices in the Press, sent to order or furnished gratis, upon application to the office.

The Earlier the Better.—Our advertisers are requested to send in their favors as early as practicable.

Good Throwing.—The Weber steam fire-engine at Stockton recently threw a stream of water 235 feet high.

The Daily Evening Star is a new and brilliant literary light which has recently made its appearance in Sacramento.

The Mining and Scientific Press Patent Agency.

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely, to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications filed in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signiture and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners in chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appelant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House corner San Sansome and Washington streets, San Francisco.

Mines of Brown's Valley, Yuba County.

MESSRS. EDITORS:—I purpose to give you some practical information concerning the mines in Brown's Valley and vicinity. The Pennsylvania is the oldest claim and one of the first locations. This Company have sunk a shaft 260 feet deep on their southern extremity, and adjoining the Jefferson claim. They have four drifts north; the bottom drift is in about ten feet; the next upward, thirty; the next, 160, and the uppermost, thirty feet. This last drift was unexpectedly pushed through to the old works, containing a large body of water; two men were working in the shaft, thirty-six feet below the drift, one of whom was drowned, and the other narrowly escaped with his life. These drifts have been run so as to give thirty feet of backs to stope out. It was well known that a large body of water still existed to the north, and three weeks ago it was determined by the President, Mr. Van Muller, to suspend operations in the shafts and bottom drifts, and to push the No. 2 drift through. On Thursday night, the 27th ult., a blast hurst through and let in some 6,000 feet of water. The pump was set to work, and in two days the water was pumped out without any damage having been done.

At this shaft they have a steam engine, with pumping and hoisting apparatus; also eight stamps and two sets of Chile mills. The vein in the bottom of the shaft, and bottom drift, is four feet thick, and looks very promising; yet the quartz crushed by the mill has hitherto failed to pay current expenses.—The quartz raised from No. 2 drift the past three weeks has been thrown away as being worthless.—They have now seventy feet of old, worked out, crushed ground to timber up and secure, so as to get to the north end of Mr. Rule's old incline, No. 1.—There are four men at this work; everything else here is idle. About 600 feet north of No. 1, is shaft No. 2. This shaft is in the central part of the claim, and is down on the course of the lode eighty feet. A drift has been run north twenty feet. Both shaft and drift have been stopped because the rock would not pay. This is somewhat singular, as Rule worked the same rock profitably, with only a windlass to hoist with, and the quartz to haul a mile to the mill.

A cross cut is being driven eastward from the end of the drift. After driving twelve feet a vein was cut through, two feet thick, composed of quartz, clay, and slate. A drift has been run a few feet north and south on this lode, without any improvement; the cross cut is in forty feet, and still going on—for what purpose is a mystery. Here they have a steam engine, with pumping and hoisting gear. This is no wild cat scheme (though we have some in this neighborhood), and I have no doubt that it will prove to be one of the best mines in the Valley; yet to effect this desirable object it must be managed very different to what it is at present. A MINER.

BROWN'S VALLEY, June, 1864.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND CIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

MINING AND SCIENTIFIC PRESS.—This is one of our most valuable exchanges. It comes to us filled with the most valuable articles, original and selected, upon the subject of mining, and we scissorize it to an awful extent. Every person engaged in mining to any extent, should be a subscriber to the PRESS.—*Golden Era News.*

BLASTING POWDER!

Prime Blasting Powder, on Consignment
And for sale in lots to suit purchasers, by
J. S. CURTIS,
6v8tf. No. 405 Front street, San Francisco.

For Sale—A Useful Invention.—EDITORS PRESS:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a device of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test, under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-4t

---

Coughs and Colds.—The sudden changes of our climate are sources of PULMONARY, BRONCHIAL and ASTHMATIC AFFECTIONS. Experience having proved that simple remedies often act speedily when taken in the early stages of the disease, recourse should at once be had to "*Brown's Bronchial Troches*," or lozengers, let the Cold, Cough, or Irritation of the Throat be ever so slight, as by this precaution a more serious attack may be effectually warded off PUBLIC SPEAKERS and SINGERS will find them effectual for clearing and strengthening the voice. Soldiers should have them, as they can be carried in the pocket and taken as occasion requires.

Agents for California, Redington & Co., San Francisco. 23-1m

Excelsior Gold and Silver Mining Company, Reese River District, Lander county, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22nd day of March, 1864, an assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable in Gold Coin of the United States to the Secretary, or to SAMUEL DONNELLY, Superintendent of the Company, at Austin, N. T. By order of the Board of Trustees.

J. CAMMET, Secretary.
20-5t Office, No. 321 Front Street, San Francisco.

NOTICE.

Is hereby given that from and after June 15th, 1864, the Office and principal place of business of the Emmett Copper Mining Company, will be removed from San Francisco to Copperopolis, Calaveras County. San Francisco, May 14th, 1864.

M. G. ELMORE, Secretary.

M. The Stock is now in the Secretary's hands, ready to be issued to all parties entitled to the same.

D. S. CUTTER, Secretary. J. R. TOBIN, President.
San Francisco, May 20, 1864. 21-4t

Assessments.

Baltimore Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held May 30th, 1864, an assessment (No. 2) of seventy-five cents per share was duly levied, payable in U. S. coin, to J. Warren Clark, Secretary, 430 Montgomery street, San Francisco, or to H. J. HAWKINS, Treasurer, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 15th day of July, 1864, at the office of the Company, at 2 o'clock P. M., to pay the delinquent assessments and cost of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
Office, No. 430 Montgomery street, No. 5, 3d floor, San Francisco.
San Francisco, June 3, 1864. 23-4t

Gold Rock Gold and Silver Mining Company, Murphy's Camp, Calaveras county, California.

Notice is hereby given that at a Meeting of the Board of Trustees of said Company, held on the 30th day of May, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day, as delinquent, and unless payment shall be made before, will be sold on FRIDAY, the 22 day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees.

EM. FENARD, Secretary.
23-4t Office, 433 Montgomery Street, San Francisco.

Coso Silver Mining Company, Coso District, Tulare County, California.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 2d day of June, 1864, an Assessment of one dollar per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold or Silver Coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of sale. By order of the Board of Trustees.

D. W. CHAMBERS, Secretary.
23-4t Office, No. 636 Clay street, San Francisco.

Stars and Stripes Copper Mining Company, Rock Creek District, Calaveras county.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of May, 1864, an assessment of ten cents per share was levied upon the capital stock of said company, payable immediately, in United States Gold Coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 21st day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. J. FINDLEY, Secretary.

23-4t Office, on Rock Creek, Calaveras county, California.

Gertrude Gold and Silver Mining Company, Reese River District, Lander county, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of May, 1864, an Assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable on the 1st day of June, 1864, in United States gold coin, to the Secretary, or to R. T. HILL, Superintendent, at Austin, Nevada Territory.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. gold coin, to the Secretary, at his office, or to the Superintendent, at the mine.

Any stock upon which the assessments shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 13th day of July, 1864, at 1 o'clock P. M., at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. J. F. MILLER, Secretary.

Office, No. 416 Washington street.

San Francisco, June 10th, 1864. 24-4t

Aspinwall Gold and Silver Mining Company, Amador District, Lander County N. T.

Notice is hereby given that at a meeting of the Trustees of said Company, held on the 10th day of June, 1864, an assessment of fifty cents (50) per share was levied upon the Capitol stock of said Company, payable immediately, in U. S. Gold Coin, to the Secretary, at the office of the Company, 429 Pine street, San Francisco, or to J. E. BOWE, at Amador City, N. T.

Any stock upon which said assessment shall remain unpaid on the 15th day of July, will be advertised as delinquent, and unless payment shall be made before, will be sold on the 3d day of August, A. D. 1864, to pay the said delinquent assessment, together with cost of advertising and expenses of sale.

24-4t JOSEPH HEALY, Secretary.

Porter Gold and Silver Mining Company, Jor-dan Hill, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of June, 1864, an Assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to J. L. PORTER, Superintendent, Yankee Hill, Butte county.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on WEDNESDAY, the 3d day of August, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,

THOS. C. McCALLAN, Secretary.

24-4t Office, No. 622 Clay street, San Francisco.

Southern Belle Gold and Silver Mining Com-pany, Reese River District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of June, 1864, an Assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 10th day of June, 1864, in United States gold coin, to the Secretary, or to R. T. HILL, Superintendent, at Austin, N. T.

Any stock upon which said assessment shall remain unpaid on Saturday, the 9th day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 23d day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. W. F. HUGHES, Sec'y.

24-4t Office, No. 6 Mead House, San Francisco.

Phœnix Gold and Silver Mining Company, Reese River District, N. T.

Notice is hereby given, that on Thursday, July 14th, 1864, at 11 A. M., at the Office of the Company, No. 305 Montgomery Street, San Francisco, there will be sold to the highest bidder for cash, so many shares of the Capital Stock of the above named Co., standing to the credit of the following named persons, as will be necessary to pay all assessments now due, together with costs of advertising and expenses of the sale, unless the same shall have been previously paid, to wit;

WANTED,
Gold Quartz suitable for Cutting Jewelry.
By **FRONTIER & DEVIERCY.**
437 Pine Street, San Francisco.
au3ltf.

Terms in Advance.—Having adopted the cash system, ALL payments for subscriptions must be made in advance. If old subscribers find their paper discontinued at any time, don't stop to grumble about it, but send in the cash for another year. "Equality is Justice," and we shall administer this doctrine to all our patrons, as well as "the rest of mankind."

How to make your Remittances.—In most of the mining towns, brokers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Wide West Copper Mining Company, Copper Canon, Calaveras County, State of California.

Notice.—There are delinquent, upon the following described stock, on account of assessments levied on Dec. 12th 1863, and March 26th 1864, the several amounts set opposite the names of the respective shareholders, as follows:

22-4t Office, 416 Washington Street, San Francisco.

A New and Valuable Book.

PROCESS OF SILVER AND GOLD EXTRACTION, BY OUIDO Kustel, Mining Engineer and Metallurgist, former manager of the Ophir Works, &c.; 350 pages octavo illustrated.

This admirable work has met with the highest commendations from the Press and Scientific men, as a clear and able exposition of the science as practised in California and Nevada Territory. It is written for the people in good plain English and finely illustrated.

Price—post paid—Cloth $6; Sheep $7.

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed
It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at
WHEELER & THAYER'S REDUCTION WORKS,
NORTH BEACH, SAN FRANCISCO,
To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.
This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to
HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

To Quartz Miners.
ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.
No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.
A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.
sep21

WHEELER'S
Amalgamating and Separating Pans
IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.
The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.
Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.
***These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.
no16-tf ZENAS WHEELER.

LLOYD'S NEW AMALGAMATOR
Is a Complete Success.
THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $40 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 6 0 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 15¼ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.
Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:
Gold.....$73 33
Silver.....42
To the Ton.....$73 75
The assay being made by Messrs. Molitor & Co.
From 20 pounds of the same ore, worked for the same party, was obtained:
Gold.....$63 30
Silver.....04
To the Ton.....$63 34
Assay made by Kellogg, Hewston & Co.
The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 51.2 per ton; and over the works at the mill, $62 54.2 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Nudge, who obtained: Gold, $1.19, Silver, $1.52, amounting to $2.71-100—equal to $361.33-100 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $ 54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.
Result of 68 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 6.18-100. Assay made by Messrs. Molitor & Co. 100 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58-00—equal to $111.60 to the ton. Difference in favor of Lloyd being $114.58-100 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustell Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's
AMALGAMATOR.
THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from
Gold and Silver Ores,
Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.
These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.
☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. etbween 3d and 4th.

Mechanical.

A GREAT INDUSTRIAL FAIR!

—TO BE—

Opened in San Francisco,

—ON—

THE 30TH OF AUGUST, 1864.

THE MECHANICS' INSTITUTE OF SAN FRANCISCO ARE preparing for an Exhibition of Arts, Inventions, Manufactures of Industry in general, upon a scale more grand, attractive and useful than ever before seen upon the Pacific Coast. Their Pavilion, built for the purpose, will occupy one of the city plazas, and will contain every convenience and appliance for an effective display. The Institute appeals to all persons within the scope of its influence, who are engaged in different branches of industry and art, to prepare and forward for Exhibition such articles as they may invent, discover, or make, that are useful, instructive, curious, or suggestive. There is scarcely an occupation in life that cannot supply some article that can be so considered, and by their public exhibition they may start the genius of invention in some other branch of industry or skill, the successful development of which may greatly enrich the State. The premiums and published reports of the Exhibition will widely advertise their qualities and merits.

Each age and country has new wants, which the progress of civilization creates and ingenuity gratifies. Those of our own day and section are improved methods and machinery for reducing ores of the precious metals. A striking feature of the Exhibition will be the number and variety of these, worked by the inventors. It is hoped that information most useful to the mining interest will be elicited. Miners are invited to send ores for exhibition, and trial, in quantities sufficient to be worked seperately in the different machines, in order to test both the relative merits of the machines and the value of the respective metallic veins.

The various transportation companies of the Pacific states and territories will, with commendable liberality, transport all articles intended exclusively for exhibition, free of charge, and Wells, Fargo & Co., in like manner, will take charge of them.

All articles forwarded should be labeled— "For the Industrial Fair," and be directed to C. B. Porter, agent.

Regulations for the Exhibition.

1—Persons intending to take part in the Exhibition are requested to make known their intention at the earliest practicable period, stating the kind of article or articles they intend to exhibit, and the probable amount of space required therefor.

2—The Pavilion will be open for the reception of articles for exhibition on Monday, the 22d day of August, and will continue open for that purpose until Monday, the 29th. The Exhibition will open to the public on Tuesday, the 30th day of August.

3—The name of every article should be attached to it; also a description pointing out its merits, when thought desirable by the exhibitor.

4—When articles are entered, a check for the same will be given, which must be presented and surrendered when the articles are withdrawn.

5—Articles intended for sale will be labelled accordingly, but cannot be removed until the close of the Exhibition, except by the written permission of the President.

6—Light, fancy or perishable articles will be received, or may be removed, at any time during the Exhibition, with the consent of the President.

7—All articles deposited will be at the risk of the owners, who are invited to be present during the hours of Exhibition. In the intervals efficient measures will be taken for the protection of property.

8—On the day following the opening of the Exhibition, each class of exhibitors will meet to choose, by ballot, their own Committees of Award; failing in this for one week, Judges will bo appointed by the Executive Committee. The Executive Committee will award premiums for such articles as the several juries shall decide to be worthy of the same. The premiums will be delivered as soon as they can be prepared.

9—The morning of each day, until 9 o'clock, will be appropriated to the judges, and visitors will not be admitted during that time,

10—In case of misunderstanding, application may be made to the Executive Committee, who will be at all times in attendance.

11—Steam power will be provided, that machinery of all kinds may be seen in operation; and every possible facility will be given to exhibit all working machinery to the best advantage.

12—Exhibitors or their agents will receive free tickets of admission when, in the opinion of the President, the articles exhibited by them have such value, interest, or merit as to deserve it; but the transfer of any such tickets will work a forfeit of the privileges conferred by them.

13—All communications to be addressed to WILLIAM PATTON, Corresponding Secretary.

Executive Committee.

IMPROVED WATER-WHEEL,

—PATENTED BY—

John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15v8-3m Golden State Iron Works, San Francisco.

Rock Drilling Machines.

HAND AND POWER ROCK DRILLING MACHINES, FOR SALE AT 25 PER CENT LESS THAN IMPORTATION PRICES, TO PEREMPTORILY CLOSE OUT THE ENTIRE STOCK.

Also, Second hand Presses as follows: One Hydraulic Press: One Screw Standing Press; One Lithographic Press. The above presses are all in good order. WM. W. DUNN.

19-1m No. 9, First Street, San Francisco.

LEANDER RANSOM,

Civil Engineer and Surveyor,

HAVING BEEN CONNECTED WITH THE PUBLIC WORKS OF the State of Ohio for 20 years, and the public surveys of the State of California for 7 years. Also

State Locating Agent,

AND AS SUCH HAVING THE SALE OF

600,000 Acres of State School Lands.

At the low price of $1,25 per Acre.

TERMS—Twenty per cent in cash and the balance on a credit of several years.

oc7-tf Office, 323 Montgomery streets.

REYNOLD'S

Patent Cut-Off and Governor,

For Steam Engines.

127 of these Invaluable Machines

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 75 per cent of the Fuel.

Steen's Improved Governor

IS THE CHEAPEST, SIMPLEST AND QUICKEST TO ACT AND least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, at the Stone Breaker, foot of Montgomery Street and at the Sugar Refinery, 8th Street, San Francisco.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., Etc., bought and sold the best market rates.

Anti-Incrustation Powder,

A sure remedy for Scale in Steam Boilers, without injury to the Iron. In use for the past EIGHT years.

AND SCIENTIFIC

Mining Press.

A Mining Journal--Devoted to News, Art, Science and Progress.

VOLUME VIII. SAN FRANCISCO, SATURDAY, JUNE 18, 1864. NUMBER 25.

LET THE MINES BE REPRESENTED.

We aro requested by Mr. C. B. Porter, tha General Agent of tha Mechanics' Fair, to invite mining superintendents and mine owners throughout the Pacific coast, to prepare for exhibition at the approaching Fair specimens from each of their mines, showing the vein-stone, together with the associate rocks and, so far as may he, the general geological character of the several districts. The Institute proposes to furnish ample room, and take charge of the exhibition of all the specimens forwarded. Specimens should be carefully labelled. The importance and interest which will attend to such a display must he apparent to all, and we trust the miners everywhere will embrace the opportunity here presented of making their several locations and districts known to the public. This portion of the exhibition will be under the direction of persons in every way competent to the charge, and if properly initiated by the mining public, will form one of the most important and interesting features of the exhibition. All parcels and packages sent exclusively for exhibition will he transported free by the various transportation companies of the Pacific States. Miners are also invited to send ores for trial in quantities sufficient to be worked separately in the different classes of machinery which will he found on exhibition, both to test the merits of the machinery and the value of the veins. Such packages will, of course, have to he forwarded at the expense of the parties directly interested. All articles forwarded should he labelled "For the Industrial Fair," and directed to C. B. Porter, Agent.

The Panic.—The so-called panic, so far as legitimate stocks are concerned, has turned out to he nothing more than a big scare caused by the timidity of a few, and the natural tendency of the many to follow any one who will lead boldly. Finding that the mines did not sink, nor the bottom of every financial arrangement drop suddenly out, the feverish excitement of the past few weeks has passed off, and men who a short time since might have been seen with elongated visages, dolefully whispering in melancholy groups, now walk the streets with head erect and countenances jubilant; and the cheerful chink of the money, as it passes from hand to hand, is heard on every side. This excitement, and its attendant reaction, has had, and still will have, good results.—It will show who are our timid sidewalk operators, who could not look into the causes of a financial revulsion any more than they could through a grindstone without a hole in it, and also who have stamina enough to look behind the curtain and profit by the causeless fright of others.

The Yuba Company have recently remitted 78 ounces of gold, the result of 6¾ days working of rock from their ledge, worked at the Pensylvania mill, Brown's Valley, Yuba county. This is the third report of a similar character made by this company during the past few months.

HOME INDUSTRY.

HUNT'S WINDMILL FACTORY.

At the suggestion of friends, who appear to take an interest in the articles we are publishing under this head, for the sake of variety we this week change the subject, and present our readers with another branch of our Home Industry, viz: Messrs. Hunt & Co's Windmill Factory, on Second street. Without meaning any disparagement to the firm, this establishment may with propriety he termed the "old curiosity shop" of San Francisco, possessing as it does so many ingenious contrivances to save power and facilitate labor, that Charles Dickens himself, the author of the original "Curiosity Shop," would find much, on visiting it, worthy the power of his vivid and descriptive pen.

The works were established in 1856 by the present proprietors, and are the only ones of the kind in the State. In the center of the works, surrounded by more pretentious buildings, and almost obscured from sight, stands the original windmill of California, a most interesting memento of our progress. It was erected in 1856, and used for the purpose of grinding corn. It had power to turn a 2½ foot stone and grind eleven bushels an hour. The first year it ground 300 tons of barley. Like other monuments of our growth still seen in our midst, it soon became unequal to the demands of an increasing population, finally ceasing to he used at all. And so it stands to-day, grim and rusty in its departed glory, like an old man clinging to the fashions of his youth.

From such small beginnings this firm has grown with our growth, until it has become celebrated in the history of the country; for, perhaps, none of our enterprising mechanics, and their name is legion, have been greater benefactors to our community, by contributing to its imperative necessities, than the Messrs. Hunt & Co., with their windmills. In our last article, on the Golden State Foundry, we referred to this establishment, and promised a more detailed account, which we this week give.

The works are situated on Second street, about mid-way between Market and Mission, on the right hand going towards the Bay, and so unpretending in appearance that it is extremely difficult to find them. On entering, however, the experienced observer will he immediately struck with the completeness and ingenuity of the mechanical arrangements; nor is his surprise lessened, when searching for the motive power of the wheels and belts spinning round in every direction, he discovers it to spring from a single horse, eternally climbing up stairs. The whole expense for motive power with this now well-to-do firm consists in the keep of a couple of horses, which relieve each other every two hours and a half. The first animal they purchased for this labor was blind, broken-kneed and old—qualities well adapted for the work he had to perform. In the pressure of business the old fellow has often worked twelve hours a day without relief, and is now fat, sleek, spunky, and apparently good for ten years more. When he goes to the spirit-land, supposing he ever does, it is to he hoped he will find the green pastures which we read about.

The firm now employs fourteen hands constantly, and in the course of the year consume an immense amount of iron and lumber. During the last twelve months they have built 150 windmills, ranging in price from $75 to $1,000. We referred in our last article to the mill at the Catholic Asylum, of this city, having the power to raise water perpendicularly 272 feet, and throwing it horizontally 4,000 feet.—This mill, we have since learned, threw 95,000 gallons of water in forty-two hours, keeping the immense tanks of the establishment constantly full with ease. The total cost was $900. Another mill on a large scale has recently been erected at the splendid suburban residence of R. B. Woodward, proprietor of the Wheat Cheer House, at an expense of $600, which, in proportion to its size, is equally effective, having thrown 9,000 gallons of water in four hours, the first morning it was put to work.

In our wanderings over the agricultural districts we have long been familiar with the power, effectiveness and durability of these mills. Throughout the valleys they are indispensable. Could they not be used to advantage by our mining population? The firm assure us they can build mills of any capacity, and guarantee with their largest size to force water *three miles* through pipes. If this long been our opinion they would he incalculably valuable in the mines, where water is scarce, and this guarantee of forcing water three miles in pipes is well worth the consideration of our readers in the mountains. Mr. Hunt politely invited us to take a drive with him in a day or two to witness an operation of this kind, and we shall then probably have more to say upon its adoption by miners.

There is much in the construction of these mills that is ingenious, novel and valuable. First, the sails, generally twelve in number, turn to the wind at any angle, or can he brought edgeway to the wind by means of a hand lever, each and all of them tending naturally to the wind without the use of a vane, from whatever direction it may be blowing. By this arrangement the speed of the mill can always be regulated in heavy winds without trouble or inconvenience. If found necessary to change the angle of the sails while running, it can he done by the lever in a moment. As the lever is the main agent by which the mill is stopped or put in motion, the firm have conceived a most effective plan of making it self-acting, and in this mainly lies the peculiar advantage of their mills. To accomplish this, a rod is connected with the lever at the foot of the mill and the rocking beam in the center, with a balance weight at one end and a float at the other. Thus when the water lowers in the tanks the float sinks; the balance weight naturally rises in proportion, and pass-

ing at last over to the other side, the lever is raised and the mill commences running. By a reverse action, in due time as the tanks fill, the mill is stopped. Thus, presuming your mill to be in good order, you will have a constant supply of water by this simple principle of self-action.

The pump attached to these mills is an invention of the firm, and is spoken of as combining great strength with simplicity of construction. It in some measure resembles the Farnham pump, only it is more simple and effective. It is equally applicable to deep dug and artesian wells, as to shallow ones, and can be either worked by the windmill, or horse or hand power. It can be taken to pieces and replaced by a common wrench, is easy to repair, and not liable to get out of order. They make five sizes of these pumps. It has also the merit of being very cheap.

Mr. Hunt's "Self Regulating Horse Power," which as we stated at first is the only motive power in the works, is very ingenious and useful, considering it can be applied to almost everything. It is valuable in small machine shops, either wood or iron, being capable of boring and drilling iron, sawing with scroll or circular saw, grinding or cutting glass, or in fact anything in the world. Its advantages may be summed up thus: It occupies a small space, runs with great regularity, has very little friction, does not clog with dust and sand, can be built cheaply, needs very little attendance, and is easily repaired. We can vouch that it is worth examining by those needing motive power of the kind.

Such is the history of our local "old curiosity shop." At the approaching Mechanics' Fair, you may rest assured it will sustain its reputation, both for skillful inventions and perfection of workmanship, doing honor to our Home Industry and mechanical progress. L. H.

The Proposed Southern California Wagon Road.

In our issue of April 16th we made some extended remarks upon a bill which has been introduced into the House of Representatives at Washington for granting alternate sections of land, at the rate of three square miles of land for each mile of road, for the construction of a road from the head of Santa Clara Valley to San Diego, and from Gilroy, *via* Visalia, to the Owens River Valley. The construction of these roads would call for about 24,000 square miles of land, embracing a large portion of the most valuable agricultural land in Southern California. The natural inference, in the absence of information to the contrary, was that private parties were at the bottom of this operation, and that a gigantic speculation, or rather swindle, was about to be perpetrated upon the people under the cover of this bill; hence we spoke in pretty sharp terms with regard to the proposition. The following letter, however, which we have just received from a member of our Congressional delegation, puts quite a different aspect upon the proposition:—

My attention has been called to the first article in your useful paper of April 16th, 1864. There is no proposition to grant lands to any individual or company, but only *to the State of California*, to aid in constructing and keeping in repair good military and post roads over the routes mentioned. The bill, I am sure, is so guarded that no individual can suffer by its passage, and if any person or persons, distinct from the whole community, is to be benefitted by it, I have no knowledge whatever of the fact. Indeed, I cannot see how that can occur, inasmuch as the grant will be *to the State*, to be used as she may see proper, but for the objects mentioned.

If some such plan of granting lands to aid in making roads had been adopted years ago, California would have been less cursed with toll roads.

I am sorry I cannot send you a copy of the bill, for it has not been printed. There is no prospect of its passage this session, as it has not been reported yet. The grant of land, if made at all, will be made to the State of California.

The bill, with the above explanation, is certainly one which must be acceptable to all Californians, and secures the interest of the people in these lands even better than though the title was continued in the hands of the Federal Government. We regret, under these circumstances, to hear that there is no prospect of its passage at the present session.

Communications.

[Written for the Mining and Scientific Press.]

The Mines of Amador County.

[CONTINUED.]

Across the ridge north of Sutter Creek, a deep ravine leads down to another westward flowing stream and the small settlement, called Amador. Along the eastern side of this ravine are located several quartz mines on a continuation of the Sutter Creek belt. Among the claims proceeding northward, are the Herbertville, possessing a thirty stamp mill, and idle for the past eighteen months, because the ledge gave out. The Monitor, on the Keystone ledge, in a clay slate formation, with a shaft 400 feet in depth, now being worked; the Geneva, on a parallel vein to the westward, with a shaft 200 feet in depth, and the Spring Hill, north of the Geneva, working a shaft and running a tunnel toward the ledge. Two moderate sized mills are here engaged in crushing quartz.

About six miles north of Amador, on the same belt of quartz, is the Hooper mine, which is held in good repute in its immediate vicinity, and is said to yield a profit of $50,000 per annum. It is rumored that a Boston company have tendered a quarter of a million dollars for the mine. The ledge is from four to sixteen feet in width, and penetrated to a depth of 300 feet. During the first two years this ledge was worked at the south end, and paid but poorly. It gives employment to a fifteen stamp mill with thirty-two pans attached.

Less than a mile west of Puckerville, I visited the Capp's company's claim, of 600 feet, commonly known as Capp's ochre ledge. It is situated near the junction of trap and slate, which former rock is either accompanied by a porphyry containing plates of feldspar, or else is transformed into a rock of that character. A little more than a year ago, the discoverer found a number of seams or veins, from three to five inches wide, of ochre very rich in gold, one ton yielding $1,800. The veins run diagonally in a northwest direction from the western edge of the trap into the slate, for a distance of eighty feet, dipping eastward at various angles, and at a slight depth are chiefly composed of quartz. According to the calculation of Mr. Capps, these veins will unite as a single ledge with one general course at a suitable depth; and the idea is quite reasonable, whatever may be the ultimate size of the vein. He finds an exact similitude between the surface appearance of this mine and one that he was familiar with at Charlotte, North Carolina, which has been worked to a depth of 1,000 feet, and during forty years given employment to 300 men and twenty-five quartz mills. The Capps claim has been prospected by surface cuts at different points along its entire length, and has a shaft on a two foot ledge at the depth of thirty feet. The quartz taken from the shaft contains considerable white iron pyrites, and is said to yield $30 per ton in gold. A small six stamp mill is in operation near the mine.

The Dakin company's claim, of 1,370, feet next south, posesses a six stamp mill. The mill and the mine are both idle.

Crossing the Cosumnes river at the Forks, I noticed about a mile and a half up the North Fork a quartz mill beside a bold reef of quartz. From a recollection of having lately seen this mill advertised for sale, and presuming it to be idle, I made no attempt to visit it, but proceeded northward over a strip of country composed of rocks altogether eruptive in their character, but containing a line of quartz, whereon, in early days, Spaniards had evidently spent much labor in prospecting, as shown by the ruins of arastras and a notched pole pendant from the center of one of the shafts. Reaching Logtown, I found a ten stamp mill engaged in crushing rock taken out some time before from a 100 foot shaft on the Bogardus claim. The yield of this quartz is $7 per ton. This mill, which is idle one-half the time, is the only one left of the four once constantly rattling away at this place.

At Placerville, my next station, there are several claims situated near the junction of a north-westerly and south-easterly dyke of serpentine with clay slate. A mile north of town, in clay slate, beneath an eastern hill of serpentine, is the Harmon company's claim, of 1,400 feet. The vein is being worked through a tunnel terminating in a shaft ninety feet in depth. A fifteen stamp mill is engaged in crushing the rock from this mine. The stuff being crushed appeared to be a mixture of talc slate, earth and quartz.

A short distance south, on the same vein, the Young Harmon Co. are prospecting their claim, with a shaft down forty feet on a vein dipping eastward, and between two and three feet wide.

A mile east, is the New El Dorado mill, an apparently well arranged affair, of four stamps, erected six months ago, and idle since a short run of two weeks, but shortly again to be set in motion. The original vein belonging to this company being only two inches wide, would not pay. Work is, however, proceeding on a larger vein.

The New York mill, of ten stamps, located further north, near the eastern side of the same serpentine belt, has also been troubled with a small vein, and is now idle.

On the south side of the town is the Pacific Co's vein, once a very profitable mine. The claim, together with a good twenty stamp mill, was sold a little more than a year ago to a party of Cornish miners for $10,000. Quite lately negotiations were underway for a transfer of the property in consideration of the sum of $50,000, but are said to have fallen through. The present owners work in the mine until they have extracted enough rock to set the mill going, when they turn their attention for awhile to the crushing operation. The portion of the vein now being mined is north of the old works, and is closely cased in serpentine. A shaft has reached the depth of fifty feet, with a southerly drift at the end of which is a chamber of quartz, six feet in width, containing coarse gold quite thickly clustered in spots.

The Atlantic company's claim, on the opposite side of the dyke of serpentine, has a lengthy tunnel, closed and idle.

At Clarksville, on my way to Sacramento, I handled a chunk of gold and quartz about the size of a man's hand, and weighing forty-nine ounces, found by one Armstrong and partner, a few days before, in a ravine two miles south of the town. It was a jagged mass of metal, with a little quartz exteriorly attached. Another piece, weighing ten ounces, and two smaller ones were found close beside it. The lucky finders had been for some time working on unprofitable strip of "old ground," but struck a spot previously untouched, where the nuggets were unearthed in shallow ground quite free of association with gravel of any kind. Found elsewhere than in California, what a furore they would have created among the acquirers of feet. To satisfy a curiosity regarding the possibility of a permanent quartz ledge near by, I visited the fortunate claim, but found nothing to induce a belief in any other than a pocket deposit. These great masses of gold generally come from veins very unprofitable for continuous working.

Alongside the Placerville and Sacramento road, two and a-half miles west of Clarksville, are several excavations and an enclosed arastas near a neat dwelling. Unpretentious as are the surroundings, yet here is a quartz ledge that by economical working since its discovery, four years ago, has yielded its proprietors $17,000 worth of gold, from a small strip of ground. The claim embraces 1,050 feet, belongs to Palmer & Co., and is called the Jersey Blue. It is a vein of auriferous quartz, in a very friable soft trappean rock, with narrow iron slate casing, dips at an angle of thirty degrees to the east, and varies in width from nine inches to two feet. An incline has been sunk to the depth of 100 feet, but is now partly filled with water. The rock and earth selected for working in the arastra averages $75 per ton. Unless I am much mistaken, a portion of the rock from this vein is more favorable for silver than gold.

Reviewing the general character of the auriferous veins of the section of country I have just traversed, I find a confirmation of my belief that the quartz veins of California are, in the main, superior to those of any other mining region. Few or none need entail any large outlays beyond the returns; that some of them have done so has been due to the want of knowledge and experience rather than to any general poverty of the veins. Much money has been frittered away in unlikely places, and through exaggerated ideas of future profits and want of that caution manifested in every other business undertaking except mining. In the quartz mills I saw few improvements, and should judge that the losses of gold in the crushing operations were but little less than in the primitive days of quartz mining. I have a suspicion that in this branch of mining, capital, inventive skill, and scientific knowledge will hereafter gain great and remunerative triumphs. M.

The bonds of the town of Gold Hill, N. T., are advertised for sale in sums of from $500 to $10,000, with coupons bearing interest at two per cent. per month.

[From the "American Journal of Science and Arts"]

The Mechanical and Chemical Treatment of Gold and Other Metals.

A LETTER ADDRESSED TO PROF. B. SILLIMAN, JR., FROM JAMES D. WHELPLEY, ESQ.

Agreeably to your request, I send you herewith a few memoranda in explanation of our new process for preparing quartzose ores of gold for amalgamation.

This process, so far as I am aware, together with all the machinery employed in it, was invented and constructed by Col. J. J. Storer and myself.

Our researches in this direction began in the spring of 1860, in Philadelphia. We experimented for several months upon a small scale, testing most of the then known processes for reduction and desulphurization of ores. It then appeared to us that processes requiring long periods of time, such as are employed by skillful chemists in the laboratory, could not be applied to large mining operations, where masses of several tons have to be treated at one operation.

A few grains of sulphurets of iron or copper heated to whiteness in a platinum capsule will be thoroughly desulphurized, but a mass of ore weighing several thousands of pounds cannot be handled in this manner. The ore fuses in this manner, taking the form of slag, and holds the sulphur confined in its substance.

If, on the other hand, the finely pulverized ore be spread thinly over a hearth fourteen feet in length and 8 or 10 feet in diameter, with free access of air, and the heat either radiated from the roof or passing up through the hearth of the furnace, a very thorough desulphurization may be effected, by constant turning and exposure of fresh surfaces, taking care that the temperature does not exceed a cherry-red heat.

A large access of atmospheric air is necessary for the management of this process, and it is aided by the addition of chlorid of sodium, and other reducents. Though perfect in the end, it is exceedingly expensive and tedious, because of the care required in regulating temperature and handling of the material

The results of the experiments with this last process were, however, very valuable to us. We discovered that the first condition of thorough desulphurization was the reduction of the ores and sulphurets to an *impalpable powder*. The reason of this is evident; viz: that the effect of heat upon a particle increases inversely as the square of its diameter.

Microscopic atoms are readily acted upon by combined air and moisture at a cherry-red heat. Pieces of the size of mustard seed will resist the action of the best managed furnace for hours, and the difficulty increases with the size of the particles directly as the squares of their diameters.

A theoretically perfect process, therefore requires:

1st. That every particle shall be microscopically small—in the condition of fine, floating dust.

2d. That the particles do not touch each other while hot.

3d. That when metallic grains, as of gold or copper, have to be separated from the ore, the contact of water with the heated particles is necessary.

We constructed a furnace in which finely pulverized ore-dust was floated in a current of hot air and flame, passing down through a flue leading from a hard-coal fire, at an angle of about 45°, and then resting upon a horizontal hearth or sole.*

We discovered at this time that moisture or the vapor of water in large quantities materially aided the process of desulphurization in free air, and we constructed and applied a steam apparatus by which a volume of steam was made to pass down the incline flue with the ore-dust, the atmosphere, and the products of combustion.

At this point we encountered several serious difficulties. The inside of the inclined flue became lined with stalactoid masses of semi-fused ores, and the sole of the furnace caked and covered with the same. When a certain quantity of burnt ore had accumulated on the hearth, a trap was opened, and the heated mass pushed through into a water-bath. The agglutinated masses, on being withdrawn from the bath, were re-ground, and passed a second time through the furnace.

A sufficiency of atmospheric air could not be applied through the furnace doors, and a very large percentage of the ores escaped through the chimney into the open air.

The last of these difficulties was overcome by placing a powerful fan wheel of copper (which served also as a water or spray wheel) in the chimney itself, or in a chamber of it, and by carrying the horizontal flue some 75 feet beyond this wheel.

The steam from the furnace and the spray from this wheel, working over a pool of water which formed the floor of a horizontal flue, effectually wetted down and saved the flying dust of ore.

The brick floor or sole of the furnace was abandoned, and a water-floor substituted. Over one end of this pool or water-hearth a perpendicular flue was erected, from 12 to 15 feet in hight above the surface of the water.

The fumes of four fires were poured into the top of this flue by the effect of two fan wheels: the first, the copper spray wheel already spoken of; the other, an auxiliary fan blower, sending air into all the fire-boxes. The top of the furnace was left open, and a column of air bearing pulverized ore, driven directly from the *pulverizing mills*, down through the center of the perpendicular flue.

The operation of this machinery balanced and regulated the force of the draft so well, that while ore-dust was driven in at the rate of 1,200 pounds an hour, carrying with it an excess of atmospheric air, if a side door of the descending flue were opened, a feather would float in the opening without being blown either way.

We then discovered that the immediate quenching of the fused particles of ore, by the water in the pool and in the chamber beyond, was essential to a thorough separation of the metals. The heated particles on touching the surface of the water are explored into still minuter fragments, a degree of fineness unattained by any other means. *The entire apparatus is constructed with a view to this result.*

The water lining the bottom of the flues is a circulation completed by an outside canal. The water thrown up from the copper dash wheel, returning circuitously, falls back into the furnace pool. This water, after some time working of the furnace, is of course charged with sulphates of iron, copper and other metals. The insoluble metal falls to the bottom with the sediment, which is composed chiefly of silicia and iron. In this sediment the gold will be found ready for washing and amalgamation.

The sediment is drawn out by the workmen as fast as it accumulates, through the submerged arches on which the brick flues or water chambers are established.

The condition of the sediment is that of a smooth plasma without grit or coarseness of grain. Using only floating dust, ten tons can be worked in ten hours with these results, in a furnace of the size indicated. More extensive machinery would give larger returns.

We built our flues and water beds under the furnace and also under the horizontal brick archway leading therefrom to the spray-wheel, of common brick, thickly covered with ordinary hydraulic cement. We found this a very good lining for the descending flue or "drop." The spray chamber beyond the dash wheel was built of wood, over a brick and wooden water channel 75 feet long, 6 feet wide, from 20 to 30 feet high. This was filled with vapor of water and sulphurous acid from the furnace pools, which made a fine rain, carrying down any minute ore-dust which might escape the action of the dash wheel, also condensing large quantities of sulphuric acid from the sulphurets.

The gold ores most free from sulphurets are easily worked. When the sulphuret is in excess, the supply of air and moisture must be proportionately large.

In regard to fuel, the finer the ore-dust before burning, the more economical the process.

In places where wood alone is accessible for fuel, the fire-boxes should be from 29 to 30 inches deep, below the fire-bridges; 8 inches for coal.

Crushing machinery.—For crushing gold ores previous to fine grinding, any ordinary machinery may be employed that will reduce them to pea or gravel-size, as they must not be larger than this before entering the *pulverizer*.

The crushing mill used by us is a patented invention of my own. It consists of a very heavy and solid bar of wrought iron, revolving in the bottom of a cast iron tub as close as possible to the sides and bottom of the tub.

This bar carries at either extremity a hardened steel or chilled-iron plate, with a cutting edge welded to a soft iron back to prevent rupture.

The sides of the tub are pierced with holes from an inch to half an inch in diameter, forming a coarse sieve.

Two of these bars may be used crossed, working *four* cutters, held together by a cast iron center piece of great strength and solidity, through which an upright shaft passes, furnished with a step and a pulley. The speed of these cutters is a little more than 10,000 feet a minute. The broken pieces of quartz are thrown out of the holes in the side of the tub at the rate of *five* tons an hour.

Pulverizing machinery.—The pulverizing of the crushed ore is performed by flat plates of thin iron faced with chilled iron, attached to radiating arms; somewhat like the paddles of a steamboat wheel. These revolve inside of a cast iron drum, as close as possible to the sides and very near its circumference. A horizontal shaft passes through the center of the drum.

The material, gravel size, is poured in on one side at the axis by an automatic hopper, which measures the quantity.

A powerful draft of air, forced through the machine by a fan blower, forming an essential part of the apparatus, draws out the dust through a hole on the opposite center of the drum, where the shaft also passes.

The dust is then carried by this fan blower and driven into the top of the furnace. The minimum rate of delivery for a mill of ordinary size is 1,500 pounds an hour.

Of this last machine I can not give you a more minute account, as its successful operation depends upon interior details, obtained by long and costly experiment. The maximum rate of production we have not yet ascertained.

All the new and important features have been patented by Col. J. J. Storer and myself.

As soon as possible, I will furnish you with working plans of the furnaces built and worked by us. We have ground the hardest copper ores of Vermont and the quartz of Nova Scotia in our pulverizing mills. I know of none more difficult of reduction.

BOSTON, Mass., March 5th, 1864.

*This furnace was built and worked in Charlestown (Mass.), in May, June and July, 1861.—J. D. W.

RIVER MINING.—The river mines throughout the State all promise well for a longer summer's work than they have had for some years. On Feather river we hear that prospectors are pitching in lively on the bars and beds with favorable indications. Sand packers are numerous, and appear to labor willingly. The river itself is lower than it has been for several years and that Scott river is receding very fast, and the miners will soon be in the stream, for the longest summer's work, probably, that has ever been known on Scott river, resulting from the unusually mild winter just passed.

COAL IN USE.—The coal found some time since in Lyon county, (N. T.), and about nine miles from Dayton, improves as the mine is worked. The stratum is nine feet thick at the present depth of the shaft, some thirty-five feet. It has been tried in a blacksmith's forge and is said to be superior to charcoal, answering all the purposes of welding and working iron. It will probably be brought into general use. The several companies holding locations on the tract have, consolidated, and the claims will hereafter be operated under joint ownership.

A TUN OF COAL.—The U. S. Circuit Court at Philadelphia have decided that the weight of a tun of coal is 2240 lbs. instead of 2000 lbs. The judge ruled that a company of grocers might as well meet and agree to reduce the number of ounces in a pound and make the smaller number the standard of a pound for their customers, as for coal dealers to agree the weight of a tun shall be 2000 lbs., and furnish that amount to their customers.

GREENBACKS.—The Austin *Reveille* says that several superintendents of mines in that vicinity have come to an agreement with their workmen to pay in greenbacks, raising the rates of wages to make up for the difference between legal tenders and gold currency. A company in Hamboldt have adopted in their by-laws a provision that stockholders may pay their assessments in greenbacks.

FIRST MILL FOR MOUNT DIABLO.—The Open Sesame Gold and Silver Mining Company having worked three lots of rock, by different processes, and obtained over $40 to the ton in gold and silver from each working, have determined to erect a mill near their mine at Mount Diablo, immediately.

TUNNEL TIMBERS.—The Gould & Curry are at present receiving from saw mills in the vicinity of Washoe, a large lot of immense beams for the purpose of timbering up the chambers in their mine. The amount of lumber required by some of the companies on the Comstock is so enormous as to be almost beyond belief.

SAW MILL FOR SMOKY VALLEY.—Thomas Burns arrived in town yesterday morning, en route for Smoky Valley, where he is about to put up a steam sawmill of fifteen horse power, for Byron Nickerson, of Suisun, Cal., who is a large owner of timber there. A fifty inch saw will be run.

NEW COPPER SMELTING FURNACE.—Parties are erecting an immense smelting furnace above North Point Dock in this city, which will be used for the purpose of reducing copper ores.

Summary of Mining News.

CALIFORNIA.

Sierra.—The *Mountain Messenger* has the following:—

Fir Cap.—Some of the boys were out prospecting for quartz, recently, and found a good prospect. They took the Mexican plan of it, and said they panned it out in an hour. They are locating claims, and great excitement prevails on account thereof.

Purp Flat.—A new ledge has been opened at this classic locality by Cole & Blackner, the rock of which looks rich, much resembling those ledges which bear fine gold. The creek against this ledge in the cañon is reported to have paid very rich.

A ledge of fine quartz has been struck at Franklin Hill, in Plumas county, about eight miles from La Porte, specimens from which show rich in gold.

Poorman's.—This quartz ledge was discovered by a hard-laboring man named Waters, who prospected it and owns a claim of about 1,000 feet. It is said to be one of the richest ledges in the State, gold being smartly diffused throughout all the rock.

Howland Flat.—Since December last between $250,000 and $300,000 in gold have been taken out at this place.

On Sunday last we were visited by our regular storm of rain and hail, which lasted about two hours, raising the rivers considerably.

The Alsop Company at Allegheny will, it is said, soon recommence work on their ledges, and employ quite a number of hands.

WASHOE.

New Mill.—Mr. Inge & Paine are about to erect a new mill on American Flat, just beyond Reed's mill. Most of the machinery is on the ground,

Crown Point Ravine Co.—This claim has already been pretty thoroughly prospected by its tunnel, and the company is now going at the work, and to the expense of erecting machinery, with a pretty clear knowledge of the worth and value of the mine. The machinery will be taken over from this city.

The Hawley Company last week struck what is supposed to be a very good ledge, in the incline, at a depth of about 200 feet. A drift into the ledge 30 feet has failed to develop the west wall. This is considered a very important development, as indicative that valuable ledges may exist in Spring Valley district, confidence in which has for some time been wanting. This discovery will operate as an encouragement for assuming operations on several claims, which have been lying idle for some time.

Dall's Mill, located near Franktown, in Washoe Valley, is spoken of by the Virginia *Union* as one of the most extensive and complete milling establishments in the Territory. The main buildings are near 300 feet in length, with a wing of 100 feet. The process of dry crushing is employed here. Connected with the establisbment are eight roasting furnaces, which are kept in constant operation, night and day. So great is the heat in this part of the work, that the workmen are obliged to relieve each other every few minutes. Eighteen Frieberg barrels are employed for amalgamating. Every possible convenience is employed to save manipulation in the various processes of drying, stamping, roasting and amalgamating. The mill has mostly been employed upon the better class of ores of the Gould & Curry, Savage, etc. Ores are sent to this mill which cannot be worked by the pan process, without previous roasting. The proprietor guarantees to deliver, in bullion, 80 per cent. of the assayed value of the ores. He proposes to erect a battery for wet crushing, with amalgamating works to correspond. The machinery is driven by a water-wheel 40 feet in diameter, equivalent to a 125-horse power engine. The mill employs about 90 men, in addition to its outside force of wood cutters, teamsters, etc.

The Andes.—This claim, which adjoins the Jewett & Shepard on the South, have struck a fine ledge of rich silver-bearing quartz.

Work has been resumed on the Baltic claim.

Steam Up.—The Overman Company got steam up for the first time on their new machinery, on Monday last.

Milton Company.—This company keeps at work in its west drift, and have now run it about forty feet into the quartz of the ledge, which it struck about a week ago. The quartz is still of about the same quality, and has about the same appearance as that first found. It is all brown gold-bearing rock, and apparently contains a good quantity of that mineral. The developments thus far has shown that there is an enormous mass of quartz down there, be its quality what it may.

Savage Company.—The work on this company's mammoth shaft is being steadily carried forward. It is now ninety-three feet. The company will soon put up machinery. They still continue to take out rich rock, and can well afford to put up machinery.

HUMBOLDT.

The workmen on the Yosemite, have uncovered a ledge five feet in width, with a two foot vein of mineral running through it. Their tunnel is in 97 feet. The work is carried on under the supervision of Mr. W. W. Woodman.

Work in the Star tunnel has commenced, and is driving ahead rapidly; in about 20 feet.

Nearly all the lumber for the Sheba mill has been delivered, and workmen are busy getting it into shape for erection.

The Pine Wood Mines still appear to be attracting much attention. A gentleman just in from that direction informs the editor of the Virginia City *Pioneer* that Mr. Sheba Hurst, the original locator of this district, has gone out to meet a large consignment of ore from the General Grant, Sheba Hurst, Cravanna, Grand Consolidated, and many others, the richness of which has already been tested, but the quantity now on the road will place beyond all controversy the fact of the richness of the district. Several sales of mines in that district have already been consummated at good figures, and it is thought that this will eventually prove one of the richest mining districts in Humboldt county.

REESE RIVER.

An increased activity, according to the Reese River *Reveille*, is beginning to be observed among the miners in the vicinity of Austin. For several months past a confidence, amounting almost to certainty, has been felt in the ultimate value of ledges where traces of silver could be found in the surface rock. When the owners of the North Star and Oregon went down on their lodes below the water line and found the remarkably rich ores that have since given their claims so high a reputation, it gave encouragement to others to do the same. Many others have gone below the water line and have their lodes regular, with a good pitch, and bearing the most valuable class of ores known. This universal success has impressed miners with the belief that good claims are the rule and poor ones the exception. The mines are certainly all that need be required, and the mill improvements now in progress will enable miners to place their claims in first class condition.

Lucretia Lode, Summit District.—Work has recently been resumed on this lode, and at a depth of 65 feet, it is found to be seven feet in thickness, and pays at Brooks Mill an average of $60 per ton. Selected rock will go much higher. The company own a good water-mill site, upon which they propose to put up machinery.

McManus Lode, Lander Hill, is owned by a San Francisco company, who are developing by an incline, now down about 65 feet. The vein is about one foot in width, and producing rock estimated to be worth about $60 per ton.

In the Canon, the mill men are generally engaged in making improvements for the more thorough working of the ores placed in their charge. The California Mill Company are erecting two first class reverberatory roasting furnaces and are also preparing their mill for dry crushing. The furnaces and chimneys are being built of stone, the fire-place and arches will be constructed of fire-brick, manufactured in upper Austin for the purpose. The first rock to be worked in them will be from the Maggie lode. In a few days the mill will commence work on the rock from the Whitlatch of Yankee Blade. The Rhode Island Mill Company are also erecting roasting furnaces, and are making preparations for more improvements. The Union Mill is busily engaged in working rock from the Morgan & Muncey claim, and is doing excellent work with it. About three tons of ore are crushed every twenty-four hours; paying near $500 per ton.

The Roanoke.—The Pioneer Mill recently crashed a lot of rock for this mine which paid, as selected, from $100 to $400 per ton—averaging $125. They are now down about 80 feet below the level of the tunnel from which it is started, and in every foot increases in favorable appearance.

Union Tunnel.—One of the great enterprises of Reese River District is the Union tunnel. It is running into Austin Hill, and if prolonged, will pierce all the best lodes known. It is now in 425 feet and about 80 feet below the surface. A few small veins have been struck, but nothing of value. It is expected to reach the Gov. Seymour in a short time, then the Southern Light, North Star, and many others. Those claims will be thus opened at a great depth and will effectually drain them, if not offering advantages for working.

Diana Lode.—The prospectors upon the Diana have lately struck a good quality of rock in their incline, below the water line, containing a large quantity of black sulphurets with some pyrites of iron. The location is a short distance southwest of the Morgan & Muncey.

Liberty Lode, San Antonio.—Five tons of rock from this lode have recently been crushed, at the Washington Mill, which yielded, according to the *Reveille*, $1,047 in silver—$209 per ton. There has several small lots of rock from San Antonio lately been crushed at the same mill, generally with very good results—from $200 to $1000 per ton.

Caledonia.—The Caledonians are reported to have made a very rich strike, the workmen claiming that it excels the North Star rock, or any other yet found in the vicinity. The incline is now down 150 feet, and of course a long way below the water. The lode is quite a large and strong one, all of which will pay well, besides having a stratum of ten inches in thickness that is almost a solid mass of sulphuret and antimonial ore, with a great many fine specimens of iodide of silver.

The Silver Circle belongs to an incorporated company, and is considered a promising claim. The incline is down about seventy feet, where the lode is about one foot in width, and produces some first quality ore. It is said that no claim in its neighborhood has gone below water without finding the same quality of rock and the varieties of ores.

A Valuable Mine.—It is stated that the Morgan & Muncey claim, Reese River, nets its owners about $1,000 per day. Messrs Morgan & Muncey own the entire claim, which contains 400 feet, and is not incorporated. The number of largely paying unincorporated claims far exceeds the number of such claims having a corporate existence.

El Dorado Cañon.—The Los Angeles *News* of June 4th says: Mr. H. R. Porter, Superintendent of the "Independence" Gold and Silver Mining Company arrived here on yesterday with a large number of "gold bricks"—one hundred pounds and one ounce of bullion, the product of the mine above named. The sight of the "oro" has caused no slight change in the minds of skeptics. Every body in the cañon was prosperous, and the miners were all greatly encouraged. A large number of lodes have been opened to a sufficient extent to guarantee a constant flow of the precious metal from the above mentioned locality, so soon as mills can be erected and set in motion. The same paper gives the following from

Holcomb Valley.—A gold bar, weighing several ounces, made its appearance here a day or two since, the product of the "Green" lode, Holcomb Valley, which is now being worked with much success. Several new discoveries have been recently made in the valley, among which is a rich extensive copper ledge.

From the "Moss."—A quantity of rich ore, in sacks, from the Moss ledge, has arrived in this city by last steamer from southern ports, consigned to W. T. Coleman & Co.

More Rich Silver Ore.—A load of silver ore, from the Techattucup mine, says the Los Angeles *News* of June 2d had just arrived there *en route* for this city.

Rich Rock.—Six hundred pounds of rock from the excelsior Company, Silver King district, are now en route for this city for assay. In appearance it is said to be exceedingly rich.

New Quartz Mill.—Wood, Marston & Dudley are about erecting a mill at Diamond Hill, Crow's site, on the East Carson, about 3 miles from Monitor. One of the partners is in this city to purchase machinery. The rock to be crushed by this mill comes from Boulder Hill, and by the arastra process of working is now paying $80 per ton.

Silver King District.—This rich mineral district says the Monitor *Gazette*, was discovered in the autumn of last year. The town of Silver King lies about ten miles from Monitor, in a southerly direction. Through this district flows the East Carson, furnishing ample power for mining and milling purposes. There are six hundred claims recorded, some few of which have already expended considerable labor, the Excelsior having a tunnel two hundred feet in length, the Chapelle two hundred and twenty feet, and the Rising Star has just commenced sinking. Twenty-five companies are incorporated, their business offices being at Silver King. T. B. Cummings is the Recorder.

The Golden Age and Empire.—A large portion of the rock which is now being taken out of this mine is said to be of extraordinary richness. Very little waste rock comes out; nearly every pound being sufficiently rich for profitable crushing.

ESMERALDA.

Rock of extraordinary richness was struck in the old Ural shaft, belonging to the Del Monte mine, sometime last week. The precious metal could be seen all through it. The Ural company had missed it when going down. The lead is said to be about three und a half feet thick, showing much gold.

Bullion.—From the 1st to the 31st of May, according to the *Times*, Messrs. Krauss and Reese assayed one hundred and thirty thousand five hundred nnd thirty-nine dollars of bullion. The same rate monthly would amount in twelve months to $1,566,468 00. This it must be remembered is only from one assay office. The amount assayed last month is not a fair criterion by which to estimate the probable sum of twelve months, because the yield of the mines is all the while on the increase. We have many reasons for believing that the mines will yield this year over two millions of dollars.

Gold in Ancient Times.—Whatever may have been the source whence the ancients obtained their gold, there is evidence that this metal was admired and valued by them as much as it is at present. Many of the accounts given by early writers dnzzle us into the supposition that the stores of gold in those days were much larger than can be commanded at present. Thus Semiramis is said to have erected statues of Jupiter, Juno, and Rbea, forty feet in height, and made of beaten gold. Drinking-vessels made of gold, and weighing twelve hundred talents, are also spoken of. The sumptuous display of precious metals in the palaces of the great are frequently alluded to; but it has been aptly observed that the quantity diffused among the bulk of the English population at the present would make a sum total far outbidding the golden wreath of those earlier days, though less obvious and glittering from being so much more diffused.

Suggestions About Advertising.

Advertising at the Mines.—Companies whose notices are required to be published in the county in which the mine is located, should be careful to have their advertisements forwarded in season.

No Assessments should be levied upon Friday where the publication is to be made in the issue of a paper published on Saturdays only, at the mine or elsewhere.

On Record.—As a large proportion of our edition will be bound and preserved in volumes, those who patronize our columns will have their advertisements preserved with a valuable record.

For Serving Personal Notices.—Secretaries patronizing the Press can have their advertisements neatly printed upon slips at $1 per hundred.

Advertising Blanks for Secretaries who design publishing notices in the Press, sent to order or furnished gratis, upon application to the office.

The Earlier the Better.—Our advertisers are requested to send in their favors as early as practicable.

Report Your Experiments.—How much that is learned by our intelligent and successful miners and mill men, is never communicated. Experiments are constantly going on, often with important results, which would impoverish no one, hy being made public, while they might save thousands to the State if they could only he made generally known. We are quite confident that there are many who possess valuable information, acquired from experience, who have no objection to making the same public, and who do indeed, communicate it to their immediate neighbors; but no farther. Here is valuable information. Why not report your experiments through the Mining and Scientific Press, the accredited organ of the miners of this State? Tell us how you get certain results, that others also may profit. You have no fears of competition. The material you are producing—gold, silver and copper, are always in demand; there is no danger that the market will be overstocked; they will always sell. It matters not if you communicate in a hurried way, so you only send us facts. We will put the same into readable shape. Report your experiments.

This journal comes to us this week with a new head and enlarged to the full size of the *Scientific American* published in New York—sixteen pages. Those who take an interest in mining, industry and art should not fail to read the prospectus of the Press, which may be found in our advertising columns, and those who may desire to see copies, intending to subscribe, will have specimens sent free on application by letter to the office of publication.—*Mountain Messenger, La Porte.*

The Mining and Scientific Press Patent Agency,

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent? A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is charged. English, French, German, Russian Spanish, and Inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the instruments and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge only a per cent age on the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their appreciation of their merits, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and attidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months...	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appelant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner San some and Washington streets, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the non-qualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Notice to James M Ross, or his Heirs:—You are requested to call at this Office, where information of importance awaits you. Said Ross left San Francisco, in June last, for Noyo Ills.

Before Cutting the Leaves of this journal, stitch each No. through the back, or fasten with a large pin, and you will have a paper in the most convenient form possible for reading or reference

We note with pleasure recent improvements in this publication. With the new year, it becomes a sheet of sixteen instead of eight pages, and has a more attractive typographical appearance. C. W. M. mith. W. B. Ewer, and A. T. Dewey are the publishers under the title of Dewey & Co. We notice that several distinguished occasional contributors have been engaged to add to the interest and value of the paper. We wish the enterprising conductors continued success. Their influence in the relation to the mining interest of this Coast is excellent and important; and they deserve, as no doubt they will receive, a large patronage from a numerous public, interested in the development of mineral wealth.—*The Evangel, S. F.*

We desire to call the attention of our readers to the advertisement of the Mining and Scientific Press, published at San Francisco. It tells its own story, and leaves nothing for us to say, except that it is the best journal of the kind now published, and ought to be patronized liberally by the merchants, miners and scientific men generally on the Pacific coast. The editors are reliable gentlemen, and well qualified for the task they have undertaken.—*North San Juan Press*

Black Sheep.—James H. Shepard, having received subscriptions for this paper in May last, and failed to account to us for the money received, we are under the necessity of announcing him as a "defaulter." Parties holding his receipt, prior to this notice, for the Press will be supplied with the subscription due by addressing us.

We are pleased to welcome this excellent paper in its handsome new dress and enlarged proportions, the energetic proprietors having commenced its eighth volume with a double-sheet.—*Ione Chronicle.*

This valuable mining journal comes to us this week in a new dress and wears a very happy face. The improvements in that paper cannot but bespeak for it a liberal patronage of all those interested in mining—and who is not in this age and country?—*The Gleaner.*

Mr. A. T. Dewey, a journalist of experience, has become associated with Messrs. Ewer and Smith in the proprietorship and conduct of this paper. It inaugurated the new year by doubling its size and other improvements, and is now a first class journal for miners and mechanics, as well as for the general reader.—*Sacramento Daily Bee*

The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.

Electric Light.—The Paris correspondent of the London *Times* affirms that a Trappist has solved the question of the electric light. He has made it regular, and reduced its production below the cost of gas. Abbaye Grace has already been lighted with it, and factories for its production are being erected at Lyons and Paris. The mode by which the inventor prepares to produce heat will be published to the world, on December 16th, and the secret of the light on the day of the opening of the new exhibition. Every householder in England will rejoice to hear that there is a prospect of so severe a blow to the avaricious monopolists, who, under the name of gas companies, tax and poison us all. They well deserve all that science can do to supersede them. For years it has been in their power, by a small reduction on exhorbitant dividends, to purify gas, and they have declined to make the attempt; so that while gas in Scotland is a pure white light, as innocuous as any other, gas in London is a yellow haze, emitting a smoke which turns silver black in three days, and spoils pictures in one.

The Virginia City *Union* ascribes the hard times prevailing there to a want of more Courts. (?)

The street posts and lamps are being put up, preparatory to lighting Virginia City with gas.

The Esmeralda County Sanitary Association have sent a silver brick, weighing 1542 ounces, valued at $4517, to the United States Sanitary Commission.

A productive mine can be worked upon to a great depth. In Europe some of the workmen have gone down as low as three thousand feet.

Record of New Incorporations.

The following is a record of the names of the companies, location of the claims, and the names of the Trustees mentioned in the articles of incorporation, filed in the County Clerk's office, in this city, since our last report:—

Hero G. & S. M. Co., Silver Mountain; Samuel S. Phillips, C. L. W. Kneller, William Vale.

Gold Bar G. & S. M. Co., Gold Hill, N. T.; M. H. Howell, Joseph Clark, Daniel McFell, A. H. Hagadorn, R. M. Heath.

Uncle Sam M. Co., Gold Hill; Thomas Bell, W. Thompson, Jr., A. Hayward, George Heart, W. W. Stow.

NEVADA TERRITORY.

We gather from the Territorial papers the following names of mining companies which have recently filed papers of Incorporation in Nevada Territory:—

Banner G. & S. M. Co., Reese River district; Wm. D. C. Gibson, W. P. Harrington, H. A. Mills, H. I. Dawicy, Jesse Oren.

Mountain Cedar G. & S. M. Co., Reese River district; G. W. Bowman, H. W. Mitchell, M. H. Hall, M. Rolling.

Alpine M. Co., Reese River district; N. Bowkofsky, H. G. Worthington, D. R. Ashley, John H. Collier, Wm. Myers.

Bombay S. M. Co., Reese River district; Louis R. Sowers, John W. Coleman, Wm. Bracket.

Monte Christo G. & S. M. Co., Palmyra district; F. Luther, B. Lanoil, O. V. Chauvel, A. Friedman, F. Elvin.

Tarsish M. Co., Amador county, Cal.; J. Davis, S. Screeber, L. L. Lewis, Charles Banelman.

Valparaiso G. & S. M. Co., Gold Hill district.

Palestine G. & S. M. Co.; A. C. Scranton, G. W. Noble, R. Donill.

Niagara G. & S. M. Co.; S. Rosenthal, C. P. Davidson, G. Kipp.

Lady Davis G. & S. M. Co.; P. Mullen, Ambrose English, John Thackeray.

Eureka G. & S. M. Co., Reese River district; S. M. Overlander, C. V. Smith, Wm. B. Gray, J. H. Page, John E. Williams.

Double Eagle Consolidated G. & S. M. Co., Amador district; H. P. Stedman, Thomas Feely, J. F. Withamp, J. Patterson, H. B. Ross.

Gold in New York.

Friday, June 10.....198.

Legal Tender Notes.

San Francisco, Friday, June 17.....52 per cent.

Mining and Scientific Press.—Having missed a few numbers of this excellent paper, we feared it had ceased to exchange; but as it has again resumed its regularity, we are a little easier on the subject. The Mining Press is an almost indispensable companion to the miner and mill man, and when in our peregrinations we find it in the cabin of the one or the office of the other, we look for, and invariably find, a superior intelligence and more satisfactory working than where it is unknown, and its precepts ignored. We would dislike to be deprived of it, either as editors, miners, millers, or mechanics.—*Reese River Reveille.*

The Press is exclusively a mining journal, and is one of the ablest sheets of its kind published in the United States.—*Calaveras Chronicle.*

Corporations.—The following "Act concerning corporations" was passed by the fifteenth Legislature:

Section 1. All associations or companies heretofore organized and acting in the form and manner of corporations, and that have filed certificates for the purpose of being incorporated, but whose certificates are in some manner defective, or have been improperly acknowledged, or have been acknowledged before a person not authorized by law to take such acknowledgements, are hereby declared to be and to have been corporations from the date of the filing of such certificates, in the same manner and to the same effect and intent as if such certificate were without fault and properly acknowledged before the proper officer, and all such certificates are hereby validated and declared to be legal, and shall have the same force and effect as if such certificates were free from all fault or defect, and were properly acknowledged before an officer having authority to take such acknowledgements.

Send them East.—Do you buy papers to send to your friends at the East? If so, please reflect that no other paper published in the State can be more acceptable to the majority of your friends than the Mining and Scientific Press. It contains a very large amount of valuable reading, nearly all relating to California and her leading interests—just the kind of general information you would give your friends if you should write. It can be had at the office of publication, neatly done up in wrappers, for mailing, at one bit per copy.

Caution.—Parties incorporating mining companies, who desire the choice of advertising in either a daily or weekly newspaper, should be particular to cross out the word "daily" when using the form of blank by-laws sold by the stationers of this city.

Mining and Scientific Press.

San Francisco:

Saturday Morning, June 18, 1864.

Another Enlargement.

With the close of the present month terminates Volume VIII. of the MINING AND SCIENTIFIC PRESS. With the commencement of the next Volume, the publishers have determined to permanently enlarge the pages of the sheet from three to four columns, a size but a trifle smaller than that of the London *Mining Journal*, the largest *mining* paper in the world. Our success during the present volume permits us to assure our readers of the permanent improvement and progress in usefulness of our journal.

June 1st, 1864. DEWEY & CO., PUBLISHERS.

Favorable to Inventors.—Persons holding new inventions o machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

OUR MINING ADVS.—We feel highly flattered with the appreciation, evinced by the mining fraternity, of our paper as a medium for their notices, and are determined to merit a still larger share of their patronage. Our circulation is not only rapidly increasing throughout this entire coast, but also in New York and other eastern cities. The enlargement of our pages on the 1st of July will give us more elbow room, and all mining notices will then be displayed alphahetically after their first insertion. Our columns will still he a trifle wider than those of any daily paper in the city.

NEW AMALGAMATOR.—Mr. M. Disney has just put in operation an amalgamator, constructed on quite a novel principle. It consists of a horizontal cylinder, with moveable dies on the lower half of its circumference, and shoes to correspond, attached by arms to a horizontal shaft revolving withiu the cylinder. This mode of constructing and operating an amalgamator must keep the pulp thoroughly mixed, while the expenditure of power is most economically applied. The machine is simple, light and inexpensive—all most important considerations. It may he seen in the rear of the Vulcan Machine Shop, on Sutter street, hetween Sansome and Montgomery. The inventors are quite sanguine of its success. Application for a patent has been made through the Agency connected with this office.

THE SACRAMENTO RIVER AND ITS PHYSICS.—We have received, in pamphlet form, an elaborate paper, prepared some time since, hy Dr. Thomas M. Logan, of Sacramento, and published in the *Pacific Medical Journal*, of this city. The paper was originally read before the California Academy of Natural Sciences, constitutes a most invaluable contribution to the cause of science, and is, we believe, the only important effort which has ever been made to place before the world the physical history and *status* of this great commercial highway of California. It was accompanied hy a chart, prepared at the instance of the Surveyor-General, who was desirous of preserving, in concise form, among the State archives, as much as possihle in relation to the periodical rise and fall of the river for several years previous. This, Dr. Logan has most happily accomplished. The facts collected and presented in this paper, apart from their scientific value, are most important in relation to the hygiene and thermology of this important river.

FOR ARIZONA.—Two steam engines, of 24-horse power each, are now on board the schooner Sovereign, bound for La Paz, and intended for the Picacho Mining Company, incorporated in New York.—This seems to he the begining of large expenditures of eastern capital in that rich Territory.

MINING SHARE MARKET.

The Mining Share Market continues active, and without any material changes from the closing prices of last week. Confidence in leading stocks is becoming gradually restored. The business of the past week reaches a very respectable figure, although somewhat under the amount of the previous week. The sales foot up at $824,869.

Ophir has maintained itself with much steadiness at about $800, hut with less business than last week. Shipments of hullion from this mine continue to come in regularly. The receipts for the present month will exceed $100,000.

Gould & Curry has been more quiet; holders are firm at $3.000 to $3.100. Sales have been made during the week at $3,150.

Savage reached $1,900 on Saturday last, dropped to $1,800 on Wednesday and closed at $1,725 before yesterday's board. The regular dividend of $50 for the present month is confidently expected.

North Potosi has been more active, opening firm at $80; it gradually declined to $66, but closed at $70 before last evening's board.

Chollar shares have been quite freely handled, hut at somewhat fluctuating rates. Opening at $600 on Monday, they advanced to $650 on Tuesday, with large sales, hut subsequently dropped to $500. It is said that about 100 tons of ore are being taken from this mine daily, which is yielding some $40 per ton.

Burning Moscow has still further receded, with a moderate business; it closed yesterday at $35.

Blue Ledge has met with a large business, at a gradual decline from $9@4½.

Lady Bryan has again become the chief feature of the market; 2,755 shares have changed hands at greatly fluctuating rates, ranging from $28 to $40. Opening at $30 on Saturday it reached $40 on Tuesday, closing at $33 yesterday. It is said that the newly found deposit of ore in this mine is of great value and large extent.

Mount Davidson, after reaching $8 on Saturday, gradually receded to $3½ on Thursday.

North American has been less active, hut is maintained with much steadiness at from $100 to $104.

Real del Monte has declined to $30, with a slight business.

Sheba has advanced to $110, 90 days.

Imperial shares have advauced from $125 to $155.

For further quotations we refer to our tabulated statement of the business of the week.

THE WASHOE STOCK MARKET, which was nearly at a stand still at the date of our last report, is still more so at the present writing. The total transactions noted for the week ending June 14th are as follows:

Branch Mint, 20 shares at $27½, s 3 days; 40 at 37½, buyer 30 days; 20 at $45, b 30; 10 at $55; 35 at $55, b. 30.

Bullion, 10 shares at $75.

The Virginia Stock Market suspended operations on Saturday last, on account of lack of business, and dissolved its organization. Most of its members joined the Washoe Stock and Exchange Board, upon an admission fee of $20, which is now the only Stock Board organization in Nevada Territory.

A NEW MAP of the vicinity of Richmond has been placed upon our table by A. Gensoul, publisher, 511 Montgomery street. The important points, to which reference is so frequently made in the telegraphic dispatches now being received from the princial seat of war, are very distinctly laid down on this map.

PLUMAS COUNTY.—Blood & Co.'s mill cleaned up after five days' run over $5,000; and the Crescent Company, with four days' crushing cleared $4,000.—The Buckeye Company is also making good returns. A new mill, known as the Golden Gate, will he running, at Round Valley, in a few weeks.

RICH ORES.—Mr. B. M. Barker, who left on the last steamer for New York, exhibited to us, before his departure, some beautiful specimens of unmistakably rich rock from the Aristides and other claims in Owens River country.

THE WASHOE, opposition steamer to Sacramento, resumes her regular trips on Monday next. Fare $1.

Election of Officers.

The following companies at their meetings during the past week, have elected officers as follows:

AMAGOZA G. & S. M. Co.—Meeting June 14th.—Trustees, R. S. Eells, A. J. Plate, G. T. Benning, E. W. Park, H. W. Walker, Chas. Steinway, J. J. Reichenhack. President, R. S. Eells; Treasurer, A. J. Plate; Secretary, B. Hall.

BLACK DIAMOND COAL M. Co.—Meeting June 14. Trustees, C. A. Eastman, B. H. Ramsdell, T. Hardig. President, C. A. Eastman; Secretary, Frank Bernard.

SANTA CRUZ G. & S. M. Co.—Meeting, June 15. Trustees, Dr. J. Regenshurger, H. W. Schmidt, H. Fisher, J. Landsberger, Henry Voorman. President. Dr. J. Regenshurger; Treasurer, J. Landsberger; Secretary, A. Marcus.

SUMMIT PASS G. & S. M. Co.—Meeting, June 14. Trustees, Capt. Ludlum, P. Trusdell, John Brazer, B. W. Madge, J. F. Larrabee. President, Capt. Ludlum; Treasurer, John Brazer; Secretary, T. B. Ludlum.

TABLE MOUNTAIN COPPER Co.—Meeting, June 13. Trustees, Jacob M. Pike, N. B. Edmiston, M. G. Elmore, Milo Calkin, J. G. Jackson.

MINING IN COLORADO.—The mines of Pike's Peak appear to he in a very flourishing condition at the present time, far exceeding those of any portion of this State and adjoining Territory. The papers from there speak of the great prosperity of the section and the immense amount of money investing in mining claims. These mines draw their supplies direct from the eastern cities, and their transaction and estimates are in greenhacks. The Black Hawk *Mining Journal* gives some interesting details of work, which shows that there can be no douht with regard to the correctness of the above. Money without limit can he obtained there for development of the mines. All these advantages are due directly to the fact that they have adopted and continued a currency there, founded upon the same basis with that portion of the country from which they draw their supplies. The wisdom of the course is fully apparent.

BROWN'S VALLEY.—Our regular correspondent states that mining matters are still going on prosperously in Brown's Valley. Some changes have been made in the working arrangements of the Pennsylvania Co. One of the batteries is at work on the company's rock, while the other is at work upon Yuha rock. The Daniel Webster, a supposed extension of the Jefferson, has recently put a small engine to work for hoisting and pumping. Their shaft is down over sixty feet, on a ledge of great thickness. Ten tons of the rock have recently been crushed at the Dannebroge mill, but the yield was small. The company hope to find hetter rock at a greater depth. The rich rock recently discovered in the Dannebroge mine is found to be quite extensive, and is giving new life and activity to the mine.

RICH COPPER AND SILVER ORE.—The Secretary of the Nacosari G., S. & C. M. Company has placed upon our table a heautiful specimen of copper ore of the peacock variety, from a shipment of six tons, which has recently been received in this city from the mine, which is located about 200 miles east from Guaymas, Mexico. This ore has been crushed at the Fountain Head Reduction Works, 537 Market street, and the mass sampled and assayed, hy Kellogg & Hewston, with the following result: 47.83 per cent. of copper and $63.54 to the ton in silver. The office of this company is on the southwest corner of Front and Jackson streets, up stairs. Ira P. Rankin, President.

MAGGIE LEAD.—Several very rich specimens of silver sulphurets have been laid upon our table from the Maggie lead, Yankee Blade district, Reese River.

DIPLOMATIC STRATEGY.

Napoleon has evidently drawn an "elephant" in his Mexican prize; but, unlike most people under similar circumstances, he has succeeded in devising a way to dispose of it. That wily statesman sees in the waning fortunes of the Southern Confederacy the inevitable fate of his new-found possessions. His pride, however, will not admit of his allowing them to be wrested from his hands. In so doing he would lose his prestige with the French people. With a show of magnificent liberality, he has sought out a "go-between" in the person of an Austrian prince, upon whom he has placed the crown of Mexico. According to the terms of the arrangement, as soon as Maximillian is once established on the throne of the Montezumas, the French troops are to be graciously withdrawn, and the newly-installed Emperor to be left to sustain his Empire as best he may with Austrian and Austria-Mexican bayonets. Napoleon will thus have his "elephant" off his hands, and when the day of trouble comes, the pelting storm will fall upon the unhappy Austrian's head, while the imperturable Frenchman will look calmly upon the roaring elements as they sweep his imperial brother to utter wreck and destruction. Napoleon will have reaped all the honors of conquest; he will have made another stride in the footsteps of his illustrious uncle, who created and destroyed kingdoms and established and dethroned kings at his will. It will be Maximillan and not Napoleon who will lose, ingloriously, the empire so gloriously won by the latter. This is but another instance of Napoleonic strategy.

While these things are in early progress there is another wily diplomatist who is not altogether an unconcerned observer of what is transpiring in this direction. It is but recently that we have heard of the failing health of Minister Corwin, and that a removal from the genial clime of Mexico to a rigorous northern latitude would be desirable by that functionary. Permission has been graciously granted by the sagacious Seward; and perhaps it will not be considered slightly significant if Mr. Corwin should find his declining health such as to render it necessary that he should leave Mexico just about the time the new Emperor will be expecting diplomatic calls from the various national representatives at his new capital. The absence of the American Minister, on account of ill-health, cannot, of course, in diplomatic courtesy, be taken amiss. The longer Mr. Corwin remains an invalid, the longer may the Government at Washington defer any official notice of a change in the Government at Mexico.

In the meantime suppose Richmond and Atlanta and some other important points in the Confederacy should change masters; who would, who *could*, prevent thousands of soldiers now in arms, from either section of the Union, whose occupation would then be gone, from moving quietly down to the Mexican frontier, and there arranging themselves once more in battle array to sustain a great American principle long cherished by all, both North and South, and embodied in the well-known "Monroe Doctrine." Juarez is already at Monterey with quite a formidable army, and has removed to that locality the still living, constitutional government of Mexico. What more glorious opportunity for the now contending factions of our people to forget their differences and unite once more under the glorious stars and stripes, and march again to victory and to the relief of an oppressed sister republic, upon whose neck a despotic foreign power seeks to place the yoke of subjection. How better could we close our family quarrel and cement the bond of Union? Napoleon may yet find a diplomatist who cannot be foiled. Corwin's leave of absence may suffice to postpone definite action upon this vexatious question until Seward can place himself in a position to defy all Europe, and fully prove himself the peerless diplomatist which his friends claim that he is.

The Plattner [Chlorine] Process to be Introduced Into the Colorado Mines.

The Black Hawk (Colorado) *Mining Journal* says that Messrs. Keith, Moller & Co. have decided to throw aside the Freiberg pans and substitute therefor the Plattner (Chlorine) Process for working the sulphuret ores, which abound to the exclusion of almost everything else in the mine belonging to that company, and indeed in most of the mines of Pike's Peak. This company, it will be recollected, is the one which has so successfully introduced a new process, known as the "Keith's Process," by means of driving, with a blast of air and flame, the finely divided particles of ore through a long furnace, the particles of ore becoming desulphurized in their passage.

The chlorine process has been successfully employed in the Reichenstein mines, in Europe, for the last fifteen years, where it is said the ores do not exceed an average yield of $8.60 per ton. Mr. Maynard, a professional assayer of New York, has recently returned from a tour of observation in the European mines, and reports that this process is coming into general use in the mines of Saxony, Selesia and Bohemia. He further intimates that it is somewhat singular that the process has not been "already introduced in the quartz mining sections of America."

To this it may be replied that there is but a very small portion of the ores of California to which the principle is at all applicable. The sulphurets alone can be worked by it. It is applicable only where the gold is exceedingly fine, as it generally is in all sulphurets. The gold, as it usually occurs in quartz, is too coarse to be taken up by chlorine gas, and would, of course, be left behind in the mass. Mr. Deetken, whose works are located on the San Bruno road, some three miles west of Montgomery street, in this city, is, we believe, the only man who has yet introduced the process into this State. He first employed it in Nevada county, removing from thence to this city some three years ago.

Chlorine, the chief agent employed in this process, is a peculiar pungent gas, the same which is so generally used in bleaching operations, and is manufactured from salt, sulphuric acid and oxide of manganese, and can be used economically for separating gold from its ores only where the above materials can be obtained in great abundance and at cheap rates. The process is applicable to gold only. It is said that the materials for the manufacture of the gas are abundant in the neighborhood of Pike's Peak. The sulphurets submitted to this process must first be finely pulverized, then desulphurized, and afterwards submitted to the action of the chlorine, in close tanks, through the bottom of which the chlorine is introduced by means of pipes leading from the generator. The gold contained in the mass (which must be very fine) is taken up by the chlorine after being submitted to its action for a few hours. The covers of the vats are then removed, water let in upon the top of the mass, and the chlorine and gold leached out, precisely as lye is leached from ashes. From the solution thus obtained the gold is readily precipitated by a simple chemical process.

This process is a very interesting and thorough one, but can never be made generally applicable for reasons given above. There is little danger that it will work any important revolution in the quartz milling business, as inferred by the Colorado *Mining Journal*.

TABLE MOUNTAIN COPPER MINING CO.—This company, located in Calaveras county, during the past week have made a sale of fifty tons of ore, at a good price. This rock assayed 21.65 per cent. The work on this claim is being vigorously prosecuted, and the prospects of the company are sufficiently good to justify them in putting steam power on their ground at once. They will in future make regular monthly shipments.

Reese River Mining Disputes.

EDITORS PRESS:—I noticed a communication in your paper of the 28th of May, by "X," in regard to the mines of the so called Bunker Hill District. As several communications have recently appeared in different papers in regard to that section of country, none of which have given the facts now existing between Santa Fe, Summit and Bunker Hill, I propose, with your permission, to give to the public through your columns a plain statement of the origin of the difficulty and the state of the mines now in dispute. I do this because I know the mines are equal, if not superior, to any yet discovered in the Reese River country, and six months from this time will prove it; but any misrepresentation or difficulties will materially injure them.

Santa Fe District was organized in March or April, 1863; Summit, 20th of June, and Bunker Hill is said to have been organized in August. The first that was known of the matter was the appearance of a copy of the laws of said District in the *Reveille*, claiming two-thirds of Santa Fe and the whole of Summit District. The miners of the last mentioned District were not notified of any intention to form a new District, and it could not be done except by the bonifide claim holders of said Districts; consequently the whole matter was illegal, and there is no such District as Bunker Hill. The boundaries of the other Districts remain as originally fixed, the miners therein refusing to recognize Bunker Hill.

The men that did this were a company of ten or a dozen, that started from Austin under the name of "the Smoky Valley Mining and Agricultural Society," (but more generally known as the "Jumpers") with the ostensible purpose of locating mines and ranches. They proceeded to Santa Fe District, formed Bunker Hill District within a few miles of the Recorder's office of Santa Fe and Summit, jumped the town site of Kingston and some of the mill sites on Big Smoky river, located thirteen quarter sections of land, and from 16,000 to 20,000 feet of mining ground, incorporated several companies and put the stock in the market. The whole thing smells very strong of wild cat.

At the time the mines mentioned by "X" were located, the parties were notified by the Deputy Recorder of Summit District that the mines were in that District, and that it would be necessary for them to record them there, or they would be located by other parties. He was insulted for his trouble. The mines were afterwards located by other parties, and properly recorded and worked. There is a suit now pending in the District Court between the two claimants. If the laws are worth anything the "Jumpers" will lose the mines, and any man that buys a share of stock will buy a law suit. The miners of Santa Fe and Summit districts have done all in their power to have the difficulty settled, but the Bunker Hill party persistently refuse.

The Gold Point mine is the Iroquois (Egla Co.), located by Dr. Goodfellow & Co., in July last, but jumped by O. Herrin & Co., who also jumped a part of the Pleasant Valley ranch. The Gold Point claim was recorded under protest in December, and the company have not a shadow of title to the mine. The company are not putting up a mill, neither do they own a single mill seat on Big Smoky.

These are the facts in the case, all of which I am ready and able to substantiate.

If newspaper correspondents would go to the districts about which they write, and inform themselves, instead of stopping in Austin and writing about matters that they are unacquainted with, it would be much better for themselves and the community at large.

By publishing this you will confer a favor upon the Recorder of Summit District, and many others.

Respectfully, R. Y. ANDERSON.

AUSTIN, June 4th, 1864.

IF you open the lower sash of a window, there is more draught, than if you open the upper sash. Explain the reason of this. If the lower sash be open, cold external air will rush freely into the room and cause a great draught inward; but if the upper sash be opened, the heated air of the room will rush out and of course, there will be less draught inward.

BULLION FROM WASHOE.—The amount of bullion shipped from Washoe during the week ending June 9th, was $288,291, an increase of $32,757 over the shipment of the week previous.

Mechanical Department.

CIVIL ENGINEERING IN FRANCE.

There is a marked difference between the condition and practice of civil engineering in France and other countries. In the former the civil engineer scarcely has an existence except as a government officer. The public works of France, such as common roads, railroads, lands, docks, bridges, works of irrigation and drainage are all directed by the Minister of Public Works, who is responsible to the Emperor alone. The civil engineering department is managed very much as an army, with a commander-in-chief at its head, and a gradation of ranks down to a simple private. This army is apportioned to different districts, each district having its subordinate chief. These districts are eighteen in number. One part of the business of the various officers is to find out what the people of their respective districts need in the way of public improvements, and how those improvements should be carried out. The engineers are all well trained and highly educated men. They are educated especially for their profession, and reach their respective ranks only on the merit of skill and proficiency, being often specially promoted for meritorious service, as in the army. The engineer corps hold high rank, but generally with poor salaries, barely sufficient to afford a living. This, however, is in part compensated by a retiring pension, when they become old or disabled. Their position in society is very high, and according to rank. An honorable position is always assigned them in all pageants, and they are not forgotten at the Imperial levees.

Mining operations in France are also regulated much in the same manner, by a special civil organization, known as the *Ingenieurs des Mines*, also under the especial supervision of the Imperial power. This peculiar feature in the industrial economy of France is no new thing with that people. It is traced back as far as to the reign of Henry IV. The system has been much improved, but in detail only, by the first and present Napoleon. No system can be more perfect in theory, and, with the exception of the extravagance always attendant upon public enterprises, might, perhaps, be profitably imitated by other nations.

French engineers, although they are thoroughly versed in all the theory of their profession, and possess a vast amount of book learning, are, nevertheless, not remarkable for originality of conception, and are far behind both English and American engineers on the score of practicability. When judged by the grandeur of their works, the French may excel; when tested by practical or commercial results, they are far behind. The execution of their works is almost faultless; their practical value is almost always disproportionate to their cost.

France, in all great and progressive works, lays back, till others have experimented; then, in the construction of similar improvements, draws all the engineering talent of the world into her service, and executes works of magnificence and durability, which are rarely equalled by any other people. This she is able to accomplish by her concentration of genius, and the unlimited millions at her command.

When the time came for canals and mail coaches to give way to railroads and locomotives, French engineers looked on doubtingly. When the effects of these improvements upon commerce was unmistakeable, French engineers began to put their genius to them with a result which, according to high English authority, eventuated in many instances in important improvements. The sewerage system of Paris was founded upon experiments made in London. France waited until the benefits in her sister metropolis were proven. The French engineers then went to work under Paris, in clear ground, and with no vested or conflicting interests to contend with, and with unlimited means at command, soon constructed a system of sewerage unequalled on the globe, and which may well be considered one of the modern works of the world. In their construction, however, the cost for show has been greater than that for utility. In nothing which French engineers have attempted has this peculiar national characteristic been more fully illustrated.

Mining Invention—an Apparatus for Indicating Quantities Drawn from Pits or Mines.—The object of this invention, which has recently been patented by Mr. George Yates, of Oswaldtwistle, is to correctly register the quantity of coal or other material drawn from pits or mines, which is effected as follows: Placed in a suitable position at or near the mouth of the pit or mine, or other convenient place, and in connection with suitable gearing, are two dial plates (the one registering the number of tubs or measures, the other the number of quarters, there being a certain number of tubs or measures to one quarter,)provided with figures or pointers, the said gearing being connected with and acted upon by means of a star-wheel which derives its motion from a projection or catch worked from the vertical shaft used in hoisting or winding the said coals or other materials, or in any other convenient manner from the said hoisting or winding machinery. As each tub or other measure ascends the pit or mine, the projection or catch before named acts upon the star wheel, which communicates motion to the gearing and figures or pointers of the first-mentioned dial plate, thus registering each tub or measure on its ascent; the number of tubs or measures constituting a quarter having ascended, the gearing will communicate motion to the finger or pointer on the second-mentioned dial plate, and register the quarters; this being repeated, the number of tubs or measures of coal or other materials drawn from the pit or mine, may be ascertained at any time on reference to the dial plates and fingers or pointers thereon.—*London Colliery Guardian.*

Improvements in Artillery.—We were shown yesterday, a very skillfully constructed model of a most ingenious piece of mechanism, the invention of Chas. W. Heath, of the battery, at this post, and for which it is his intention to take out a patent as soon as possible. It would be manifestly improper to explain the particulars until the patent is effected. Suffice it to say that the object is, by mounting on one carriage four guns, to work them with the same number of men, four instead of nine to each, as at present, and by a peculiar process of breech-loading, to enable the guns to be fired ten times in a minute. It ought to be added that the success of the invention is proved to a demonstration in the minds of such military men as have examined it, and we wish its inventor success in procuring a patent for it, and that remuneration which he deserves for the length of time he has spent in perfecting his ideas. The model is workman-like, and the drawings clear and distinct.—*Union Vidette, May 31st.*

A New Method of Using Petroleum.—M. Forcauet, of Paris, announces a new method for burning petroleum, after the manner of gas. The fluid is driven by mechanism which is not described, through pieces precisely similar to gas pipes, and issues through burners of a peculiar construction, arranged in the same positions as ordinary gas burners. The force that drives the liquid through the pipes would eject in a stream from the burners if the flow was not controlled by a regulator, which, of itself, forms the chief feature of the invention. It is said that one of the most frequented saloons in Paris has been lighted by it for six months. The Gas Light Journal of that city suggests that the city authorities should prohibit the distribution of liquid petroleum in pipes on account of the great danger to be justly apprehended from fire.

A Useful Invention.—Mr. F. A. Morley, of New York city has recently patented an invention for making a noiseless cog-wheel. The invention consists simply in casting the centre or hub of the wheel and the periphery in separate pieces. These pieces are so cast that each of the arms, when brought together are joined after the manner of a "splice" and a piece of gutta percha placed between the parts of the splice so as to completely insulate the center from the circumference. The splice may be secured by screws or in any other manner. The noise produced by the running together of the cogs is of course absorbed by the insulating medium. Its utility in many cases must be apparent.

The Los Angeles *News* has intelligence from Catalina Island, to the effect that mining operations are progressing finely. A silver and galena bearing lode and a copper mine, are among the recent discoveries.

Heat and Force.

Whenever friction is overcome, heat is produced; and the amount of heat so produced is the exact measure of the force expended in overcoming the friction. Says a distinguished lecturer, while speaking upon the subject of "Heat Considered as a Mode of Motion:"—"We usually put oil upon the surface of a bone; we grease the saw, and are careful to lubricate the axles of our railway-carriages. What are we really doing in these cases? Let us get general notions first; we shall come to particulars afterwards. It is the object of the railway engineer to urge his train boldly from one place to another. He wishes to apply the force of his steam, or his furnace, which gives tension to the steam to this particular purpose. It is not his interest to allow any portion of that force to be converted into another form of force which would not further the attainment of his object. He does not want his axles heated, and hence he avoids as much as possible expending his power in heating them. In fact he has obtained his force from heat, and it is not his object to reconvert the force thus obtained into its primitive form. For, by every degree of temperature generated by the friction of his axles, a definite amount would be withdrawn from the urging force of his engine. There is no force lost absolutely. Could we gather up all the heat generated by the friction, and could we apply it mechanically, we should by it be able to impart to the train the precise amount of speed which it had lost by the friction. Thus every one of those railway porters whom you see moving about with his can of yellow grease, and opening the little boxes which surround the carriage axles, is, without knowing it, illustrating a principle which forms the very solder of Nature. In so doing he is unconsciously affirming both the convertibility and the indestructibility of force. He is practically asserting that mechanical energy may be converted into heat, and that when so converted it cannot still exist as mechanical energy, but that for every degree of heat developed a strict and proportional equivalent of *locomotive force* of the engine disappears. A station is approached, say at the rate of thirty or forty miles an hour; the brake is applied, and smoke and sparks issue from the wheel on which it presses. The train is brought to rest: how? Simply by converting the entire moving-force which it possessed at the moment the brake was applied, into heat.

The Golden Rule.—This side-wheel steamship, 3,500 tons, constructed by Henry Steers for the Roberts' Opposition Line, takes her place in the line on the 23d of this month from New York. The dimensions are as follows: 310 feet long, 44 feet 6 inches wide, and 24 feet 6 inches deep. She is very heavily built. Her frame is entirely of white oak and locust, which is thoroughly iron-braced and strapped. Her floors are filled in solid, and caulked.—She also has four water-tight compartments. Her engines were built by the Morgan Iron Works. Diameter of cylinder, 81 inches; stroke of piston, 12 feet; diameter of piston rod, 8½ inches; diameter of crank-pin journal, 10½ inches; length of crank-pin journal, 3 feet 6 inches; diameter of beam center journal, 12 inches; diameter of water-wheels outside of buckets, 30 feet; width of buckets, 12 feet; diameter of water-wheel shaft journal, 18 inches; length of water-wheel shaft journal, 20 inches. She has surface condensers and tubular boilers. As regards her means of ventilation, neither pains nor expense has been spared to make her rank A 1 in that respect. Her model is extremely beautiful, being similar to that of the Adriatic, and as to her speed, she is very fast, having made fifteen miles per hour on her trial trip.

An Iron-clad Company.—The recent defects in many of the iron-clad vessels in use in the navy, and especially their deficiencies in seagoing qualities, have induced some of our own most scientific engineers to study the matter more closely than ever before, and the result has been a patented invention which, it is claimed, will obviate all the present difficulties and render iron-clads seaworthy, more buoyant, and able to carry in the heaviest weather a greater amount of iron plating than any ships yet built. A company for the construction of vessels on the new plan is forming in this city under the name of the "American Ship-Building Company.—*N. Y. Eve. Post, May 11th.*

New Car Invention.—There is a new car invention—by a Boston mechanic—which will add much to public convenience and security if it is adopted into general use. It is a two-story car—will accomodate more than double the number of passengers now transported on the same base, and is so constructed that the upper story can be used for a smoking or sleeping apartment with perfect ease.

Patent Department.

A New Water Wheel—*A California Invention.*—Mr. B. Fauchery, of Nevada county, has recently invented and put into practical operation an hydraulic wheel, of a simple and compact construction, yet most effective in operation. Mr. F. has put one of these wheels into operation at the new quartz mill recently erected by Mr. L. E. Charonett, about a mile and a half southeast from the town of Nevada. It is known there as the "French wheel." The editor of the Nevada *Gazette*, who recently examined it, says:—"It is about eight inches in diameter and a foot in length, of cast iron, and in pattern something like a double turbine wheel. It is enclosed in a cast-iron case not much bigger than a large-sized stove pipe hat. The whole affair, though made of iron, could be picked up and carried off by a man of moderate strength were it not that Charronatt has fastened it securely to a couple of heavy timbers. A head of from fifty to sixty inches of water, with a fall of 125 feet, turned into this little insignificant looking affair through a pipe converts it into a 30-horse power engine, which performs steadily and smoothly, and with wonderful simplicity." The inventor had previously put up one of these wheels for the Fellowes Company, at German Bar, on the Yuba river. Preliminary applications for a patent for this invention have been made through the Patent Agency connected with this office.

A Pan for Dry Crushing.—Mr. Faucher has also applied, through the Agency connected with this office, for letters patent for a mining pan of his invention, which is designed to grind the quartz dry. This pan is constructed so as to work very much upon the principle of the ordinary mill-stone—the upper and lower portions (corresponding to the upper and nether mill-stones) are cast very heavy. Strips of wrought iron are placed into the mould before casting, so as to be imbedded into the face of the grinding surface. The quartz is fed to the machine after being reduced by previous stamping to about the size of peas. The two grinding surfaces are held to their places by set screws above and below. The machine is so constructed as to allow of the outer surfaces of both the upper and lower grinding plates to be constantly submerged in a constantly changing bath of cold water, to prevent the plates from becoming over-heated when in operation. Mr. Faucher claims that he can reduce rock to the desired fineness more effectively, and with less cost, with this machine, than by any other machine in use, either wet or dry, and also preserve the universally acknowledged advantages of the "dry process."

A New Wine Press—*A California Invention.*—Mr. Elisha W. Walton, of Drytown, Amador county, has shown us a model of a wine press, which is also equally applicable to compressing almost any substance, however bulky. The machine is very compact and simple; easily washed, and capable of exerting almost any desirable power. Mr. W. has made application for a patent for the same through the Agency connected with this office.

A Machine for Turning Statues has been produced in New York, on the principle of Blanchard's method of turning irregular forms. The cutting tool in this instance is a sharp steel drill, rotating with great velocity. A bust of Daniel Webster, turned out with this machine, was exhibited at a meeting of the Polytechnic Association, at the Cooper Institute, New York, on the 28th of April, in which the likeness of the great orator was said to have been almost perfect—the deep, cavernous eyes and calm, thoughtful expression being reproduced from the original with the most delicate fidelity.

The new ferry boat for the Oakland Ferry line has been launched. She is built on the New York plan, with an entrance at each end.

The Use of Water with Fuel.—There is no absolute increase of heat from the decomposition of water and the burning of its elements. Such a problem would be very much akin to that of perpetual motion. A very important economy doubtless arises from the mechanical action of water or steam on coal or other fuel, but no positive increase of caloric.

A furnace has been in use for some time at Newark, N. J., constructed on the following principle:—The air enters through hollow grate-bars, and issuing from holes in their lower sides passes up between them to the fire. This circulation of air prevents the bars from melting or burning. Wet tan bark, dripping with water, is shoveled into the furnace, and an intense heat is the result. Whenever the furnace doors are open the interior of the furnace is filled with smoke, but as soon as the doors are closed the smoke disappears, and a passer-by would not know from looking at the chimney that there was any fire in the establishment.

At the Providence gas works, superheated steam is used in the furnaces employed for heating the retorts, and the saving of fuel is said to be fifty per cent. Twice the amount of coke is produced when steam is used in the furnaces, as when steam is not thus employed. The waste heat from the furnace passes through an upright boiler in the rear of the retorts, and the steam is brought forward through a pipe which is coiled around the fire-box, five jets above the grate and two below, on each side. The heat in the furnace is so intense that they are obliged to use clay retorts for making the gas; iron would soon burn out. The above facts were elicited at a late meeting of the Polytechnic Institute, at New York.

Earth in the Sacramento River.—Dr. Logan, of Sacramento, publishes an article in the *Pacific Medical and Surgical Journal*, in which he makes a calculation as to the amount of solid matter that floats past Sacramento in the waters of the river:

We are not aware that a sectional area admeasurement of the river has been made; but estimating the amount of water which passes down the river each second, during high water, at 327,600 cubic feet, we find on an average there are carried in suspension past Sacramento City—(a certain portion being deposited as is shown by the elevation of the low, as well as high water marks on the chart)—150,569,012 and 380-486ths grains per second, or 38,717 and 7-10ths tuns every hour, more or less, according to the stage of the American river—this affluent, owing to mining operations, being always most charged with detritus. The solid material, thus ascertained to be suspended in the water, is found, on calculation, to be sufficient to cover in one year a square mile to the depth of 256 and 5-10ths feet.

Singing Fishes.—Dr. Dufosse has communicated to the French Academy an account of certain researches which he has recently made into the vocal powers of fishes. His observations have been confined chiefly to the species *Trigla* and *Zeus*—gurnards and dories. He ascertained that the sounds proceeded from the vibration of the muscles belonging to the air-bladder, and that in some of the former these sounds may be heard six or seven yards.—The sounds were both short or instantaneous and prolonged; the pitch often varying during a single "sonorous emission." In some instances a large number of completely distinct sounds were produced, variously modulated.

New Uses of Iodine.—From the specifications recently issued, of a patent by Professor Hofmann, of London, we learn that a new coloring matter, which dyes silk and wool of a beautiful violet, blue violet, or red violet tint, has been produced by the application of iodine extracted from sea-weed. It has long been thought that if iodine could be used as a coloring substance it would be one of the most powerful known. The patented process consists of mixing in certain proportion the substance called rosaniline with the iodides of ethyl, methyl, or amyl. This dye may be used in the same manner as the aniline colors, and is already in the hands of practical people in all the manufacturing districts, and bids fair to be "the color" of the season.

A New Mining Process.—The Virginia papers state that a new process, known as the "Rivot Process" for working minerals is about to be put into practical operation in that city some time during next month. It claims to be able to work any kind of mineral and silver and gold with but a trifling, if, any loss, and at about the same expense as is incurred now. The process has been patented in the United States, Mexico, Pern, Chili, Bolivia, Spain, Russia and the Province of Mendoza. Rock paying $10 per ton in silver could be worked to advantage with this process in Europe. We have heard considerable talk about the process, in this city, for some months past, and shall be happy to give the public any results which may be obtained from its practical application. It is certainly a great desideratum to be able to work a silver ore, profitably, that will not return a gross yield of over $20 or $25. Such a result would give large value to hundreds of veins that are now worthless. Perhaps it may not be too much to expect, in these times of improvement and invention. We prefer to speak encouragingly of all experimental operations; as by throwing discouragements in the way we *may* put afar off important improvements, which might otherwise be brought to benefit the present day and generation.

The drains of Paris are declared to be the most wonderful work of the kind ever executed. Hundreds of hollow tubes, each one a marvel of solidity and skill, run from every quarter of the town to one immense receptacle of the filth and waste water thus carried off. Before the mouth of this hideous reservoir is placed a grating, through which the mass of infection pours night and day. This grating is meant to prevent the passage of any object beyond a certain size, which might otherwise obstruct the tube.

These sewers are built in a style of magnificence which might be expected from a body who were not limited as to expense. The large intercepting sewers are made with footways on each side. Those along the Rue Rivoli and the Boulevard Sebastopol are so large that a full-sized man can walk on the footway with his hat on. They are kept in a state of cleanliness that is surprising. The steps that lead down to them are wide enough for two persons to descend side by side. A railway runs along the edge of each of the footways of the large sewers, and below is the invert forming the sewer proper. An exceedingly well devised apparatus travels up and down this railway, and mechanical scrapers keep the bottom of the sewer constantly cleansed.

Manufactures.—The rapid increase of the manufactures of the United States, has no parallel in history. During the decade which closed with 1860, this department of national wealth outstripped all others—and since that time, the progress has been in an increased ratio. From 1850 to 1860, the increase was eighty-six per cent; the value of the manufactured articles being at the last census $1,900,000,000. The product of the last four years will, in all probability, exceed that of the previous ten years. The demands growing out of the increase of population, and the necessities of the war, have taxed all branches of manufactures in the United States to their utmost capacity. Throughout the New England and Middle States, factories are springing up to meet the increased demand. We are told that these States are now reaping a rich return for their labor. The inventive genius of the Yankee nation is constantly bringing out new, or improving upon the old methods of the manufacturing world, and soon, we doubt not, the manufacturers of the United States will be able to compete with those of France and England.

To Prevent Hydrophobia.—Take immediately, warm vinegar or tepid water, wash the wound clean therewith, and then dry it; pour then upon the wound a few drops of muriatic acid. Mineral acids destroy the poison of the saliva, by which means the effect of the latter is neutralized.

Another Remedy.—A dog-keeper in England, who was bitten eight times by rabid dogs each time averted the horrors of hydrophobia by allowing the common nitrate of silver to filter the wound, which decomposed the saliva, and thus destroyed the virus. A London physician adopts and indorses the remedy.

In the neighborhood of the Caspian Sea, petroleum is used as fuel by impregnating clay with the combustible fluid. The Norwegians mix tar and sawdust, molded in the form of bricks, and burn in a similar manner.

BRIEF MENTION.

Ship-builders and owners, of Bath, Me., have sold ships enough to Europeans, since the commencement of the war, to amount to $3,000,000 in gold. Of this sum $2,000,000 are still on deposit in Europe.

The two years' term of most of the San Francisco Notaries appointed by Governor Standford has expired. The office is in demand.

State Capitol.—Work upon the State Capitol is still progressing, slow but sure.

Weighing so many "stone" is often seen in English prints. The weight is thus defined: A stone. horseman's weight and of iron is 14 pounds; of glass 5 pounds; of butcher's meat, 8; of hemp, 32; and of cheese, 16.

An Indian in a good state of preservation, was recently exhumed from a salt-hed in Nevada Territory.

The mountain roads are all in fine condition, and hundreds of prairie schooners are rolling over the Sierras hitherward hound.

A considerable amount of machinery is at present crossing the Sierras for various mining sections in the Territory.

Heavy Scales.—The proprietor of the "Willows," near American Flat, Washoe, is erecting the largest scales for weighing quartz ever put up in the Territory. Their weighing capacity is 35,000 pounds—over sixteen tons.

An effort has been made for the establishment of a corps of naval engineers, with Ericsson at its head.

The Opposition Steamer Washoe will take her place again up the Sacramento river, on Monday, when lively times may again he expected on each opposition day.

Mr. Perry Jones has been elected Recorder of Reese River District. Several amendments to the mining laws went into effect on the 4th inst.

The Indiana Ranch Gold and Silver Mining Company have filed their certificate of incorporation in the Clerk's office of Yuha county.

California Pea-nuts.—Pea-nut raising is still on the increase in California. It is said that the crop for the present year promises to he several hundred per cent greater than any former one. Some idea of the importance of this crop may he inferred from the fact that a firm in this city paid $5,000 for the crop of one ranch on the Sacramento, last year; and the same ranch will have double the crop this year.

Considerable alarm is felt throughout Marin county on account of the scarcity of water. A meeting of citizens of San Rafael was held last week to devise ways and means to introduce water from Dixon's Springs into that town.

The Open Sesame Gold and Silver Mining Company, at Mount Diablo, will shortly have their new mill up and in operation.

We learn from San Diego that the Escondido Gold Mining Company cleaned up from their first week's run elevcu hundred dollars.

Scaddon & Co., in Grass Valley, Nevada county, recently crushed 41½ tons of rock, which yielded $12,516—equal to about $300 per ton.

Loryea's Mining Directory.—We have secured a copy of Loryea's Miuing Directory for Nevada Territory. It is a small pamphlet of fifty-six pages, containing a general list of companies, quartz mills, reducing works, together with a brief synopsis of many other things pertaining to the mining interests of Nevada Territory. From it we gather the following items;

The number of steam engines for hoisting purposes in the Territory is estimated at 37, with an aggregate steam power of 1,923 horse. The number of engines for mills, 85; steam horse-power, 3,389; number of mills, 95; number of stamps, 1,259; crush per day, 1,791 tons; arastra mills, 10, containing in the aggregate 34 arastras; of the above mills 33 are worked by both water and steam power. In Esmeralda there are 10 mills with an aggregate of 103 stamps, and crush per day 122 tons of ore. There are about twelve mills iu course of erection in Gold Hill, and six in Washoe Valley. In Reese River there are about nine mills in course of erection.

Correspondence.

[Written for the Mining and Scientific Press.]

From Ione City, Nye County, N. T.

Editors Press:—In writing you from this place, I am not unmindful of the fact that few of your readers will probably understand where it is. I must therefore add to their geographic knowledge by explaining that Ione is the county seat of Nye county, and that Nye county consists of a tract of country some eight or ten thousand miles in extent, forming the southeastern corner of Nevada Territory. Ione is about 130 miles E.S.E. of Virginia City, and nearly the same distance and direction from Carson. It is 60 miles S.S.W. of Austin, and 35 miles S.E. of Middle Gate on the overland stage road. The town is situated in a broad ravine on the western declivity of the Shoshone range of mountains. Though not yet six months old, it contains nearly 300 houses, and hard upon a thousand inhabitants. The principal mining districts iu this county are the Union. in this neighborhood, the San Antonio, 60 miles further south, the Mammoth, ten miles west, and part of Washington, to the east of Reese River, being on the west side of the Toyahee mountains, with the Bunker Hill, Smoky Chimney and La Plata districts on the eastern slope of that range.

The character of the mines in the Union district is similar to those about Austin, the ledges here, as a general thing, being larger. Here they vary from three to ten feet in width, while there they are not more than two or three feet wide Here they pitch at an angle of seventy or eighty degrees; about Austin many of them lay quite flat, the pitch being not more than forty-five degrees. The ore is the same in both places—rich chlorides and bromides, above the water level, and the sulphureted ruby silver below. Quite a number of claims have now been opened in this district to a depth running from forty to sixty feet. In every case, so far as I have examined or heard, the ledges have maintained themselves well, growing larger and richer as descended upon. Several claims that I might mention look exceedingly promising, having turned out large amounts of rich ores from the prospecting shafts. Some of this ore, without being closely sorted, yields at the rate of $1,100 to the ton, by working process. Some of them, it is calculated, will yield $400 or $500 to the ton, working everything between the walls. Owing to the abundance of fuel, grass and water, ores can be reduced here at half the cost about Virginia City. Wood of the best quality for generating steam can be had in Ione at three dollars a cord, and owing to the great quantities of timber close at hand it can never he much dearer. So favorably do I think of the mines here that I should recommend them to the attention of millmen and capitalists before any others that I know of. In buying into them no one need go altogether at random, many of the ledges being sufficiently opened to enable one to judge of their value. Mills are greatly needed here, and though arrangements have been made for bringing in several, this is still a fine field for engaging in the business. ***

Ione City, N. T., May 25, 1864.

[Written for the Mining and Scientific Press.]

Smoky Valley District, Reese River.

Editors Press:—In spite of the tight times in this Territory, the work of developing the miues in this section still proceeds. At a meeting of the miners of this, the Smoky Valley district, held on the 14th of May, a law was passed requiring that one day's labor should he performed on each claim of 200 feet in the district, within each and every month. With scarcely an exception the so-called first-class claims have commenced operations, and will not stop until $1,000 shall bave been expended, which is the limit that has been set to make mines "real estate" here. A few are now numbered in that list, hut that few pay no regard to district laws. They started to develop their mines, and will continue until they are proved worthless or valuable.

THE ANTIQUARIAN

stands pre-eminently among this number. Work was first put on the croppings until the company were satisfied that they had a good mine. Every day showed fresh indications of richness, and from $50 on the very top, at a depth of 18 feet an assay of $993.86 per ton was obtained. Then, as a greater depth could he gained, and in the middle of the location, by a tunnel from the creek, than could he reached hy a shaft or incline, the company hegan a tunnel, which will tap the ledge at a depth of about 200 feet. Several small veins have heen crossed in the tunnel, all of which contain much silver, some having been tested hy the Superintendent here. His process is to erush in a mortar, then roast over a fire in a frying-pan and amalgamate with salt and quicksilver in a bake oven or hettle. I hardly think this should he called the "sage hrush process." On straining, the hullion is always found. The tunnel is now very near the ledge, and may strike it any day. There are but 600 feet in the location, and the croppings are plain and positive—some distance on each end of the original claim holding an average width of four feet, and straight as an arrow. The company have a mill site adjoining the mine, and have made arrangements to have their mill in operation as soon as sufficient ore has heen taken out to keep it going. This will be the first ledge opened helow a water level in this valley.

OTHER MINES.

The Ellery, Comstock, Masonic Tunnel, Clinton, Gold Eagle and Great Central companies, in this canon, are also at work. A shaft is being put down on the latter, which will soon show what is to he expected from it. There are 1,400 shares in the location. The ledge is a very large one, and stands up bold and prominent more than half the distance of the claim. There is more quartz in this claim than can be disposed of in a century. The croppings have every indication of being all that is desired.

It seems to he the great trouble here that we have too large a scope of rich mineral. The Toyahee range, as far as prospected, has shown itself rich.

The subject of greenhacks for currency is heing agitated here, hut no definite settlement has heen arrived at. Why not issue a stock currency? then every one will have plenty of money, and the present crisis will be laughed at. Feet, of conrse, will he accepted at par, and coupons could he affixed, with the slight difference that instead of calling for interest from the holder, it would he for assessments, *payable in stock.*

The town of Clinton still improves, hut slowly. A post-office will he established here on the first of July, with a semi-weekly mail, and supply a want which has been felt for a long time.

Clinton, June 8, 1864. Unassessable.

Experimental.—It will be recollected that Dr. Hall, of Sacramento, has recently heen experimenting with reference to ascertaining the force and retention of the venom of the rattlesnake. His experiments go to establish the fact that this venomous reptile cannot strike more than two or three times without losing the force of his venom, to such an extent as to require some twenty-four hours, more or less, to restore his power, in that respect. He has now procured a still larger snake than the one hitherto operated with, and will submit to his snakeship larger game. A cow has been obtained for the purpose.

BLASTING POWDER!

Prime Blasting Powder, on Consignment

And for sale in lots to suit purchasers, by
J. S. CURTIS,
6v8tf- No. 405 Front street, San Francisco.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Cientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Mr. Jarvis Jewett is our duly authorized advertizing agent and collector in this city.

Assessments.

Baltimore Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held May 30th, 1864, an assessment (No. 2) of seventy-five cents per share was duly levied, payable in U. S. coin, to J. Warren Clark, Secretary, 430 Montgomery street, San Francisco, or to H. J. Hawkins, Treasurer, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 15th day of July, 1864, at the office of the Company, at 2 o'clock P. M., to pay the delinquent assessments and cost of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, No. 430 Montgomery street, No. 5, 3d floor, San Francisco.
San Francisco, June 3, 1864. 23-4t

Gold Rock Gold and Silver Mining Company, Murphy's Camp, Calaveras county, California.

Notice is hereby given that at a Meeting of the Board of Trustees of said Company, held on the 30th day of May, 1864, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day, as delinquent, and unless payment shall be made before, will be sold on FRIDAY, the 22 day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the sale. By order of the Board of Trustees.

EM. FENARD, Secretary.
23-4t Office, 433 Montgomery Street, San Francisco.

Coso Silver Mining Company, Coso District, Tulare county, California.

Notice is hereby given, that at a Meeting of the Board of Trustees of said Company, held on the 2d day of June, 1864, an Assessment of one dollar per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold or Silver Coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 2d day of July, 1861, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of sale. By order of the Board of Trustees.

D. W. CHAMBERS, Secretary.
23-4t Office, No. 636 Clay street, San Francisco.

Gertrude Gold and Silver Mining Company, Reese River District, Lander county, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of May, 1864, an Assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable on the 1st day of June, 1864, in United States gold coin, to the Secretary, or to R. T. Hill, Superintendent, at Austin, Nevada Territory.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. F. HUGHES, Secretary.
23-4t No. 305 Montgomery street, San Francisco.

Monarch Gold and Silver Mining Company, Reese River District, Lander County, Nevada Territory.

Notice is hereby given that at a Meeting of the Board of Trustees of said Company, held on the 28th day of May, 1864, an Assessment of 25 cents per Share was levied upon the Capital Stock of said Company, payable on the 1st day of June, 1864, in United States Gold Coin, to the Secretary, or to R. T. Hill, Superintendent, Austin, N. T.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 2nd day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

W. F. HUGHES, Secretary.
23-4t Office, No. 305 Montgomery Street, San Francisco.

Sun Francisco Gold and Silver Mining Co. Sierra Madre Gold and Silver Mining Company. Empire Gold and Silver Mining Company, Rock Spring District, San Bernardino county, California.

Notice is hereby given that at a meeting of the Board of Trustees of said companies, held on the 31st day of May, 1864, an assessment of five cents per share was levied upon the capital stock of each of said Companies, payable on the 2d day of June, 1864, in United States gold coin, to the Secretary.

Any stock upon which said assessments shall remain unpaid on Saturday the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 16th day of July, 1864, to pay the delinquent assessments, together with costs of advertising, and expenses of the sale. By order of the Board of Trustees.

G. BOWER, Secretary.
23-4t Office, No. 611 Clay street, San Francisco.

Siskiyou Lion Mining Company, Siskiyou County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 26th day of May 1864, an Assessment of Fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, in U. S. Gold Coin.

Any stock upon which assessment shall remain unpaid on Saturday, June 25th, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, July 12th, 1864, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAS. C. NORRIS, Secretary.
Office, No. 430 Jackson street.
San Francisco, May 27th, 1864. 22-4t

Henry and Barnard Consolidated Gold, Silver and Copper Mining Company, Arizona Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 2nd day of June, 1864, an Assessment of Twenty (20) cents per share was levied upon the Capital Stock of said Company, payable on the 3d day of June, 1864, in United States Gold Coin, to the Secretary, at his office.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2nd day of July, 1861, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale.

On all Certificates of Stock advertised for sale as delinquent, the holders will be charged by the share to pay expenses.

A discount of three per cent. will be deducted on all assessments paid on or before the 11th day of June. By order of the Board of Trustees. I. M. BLOOD, President.

GEO. W. GILDERSLEEVE, Secretary. (23-4t)
Office, 302 Montgomery St., third floor, room 5, San Francisco.

Pensiee & Sparks Gold and Silver Mining Com- pany, Reese River District, Lander county, Nevada Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 28th day of May, 1864, an assessment of twenty-five cents per share was levied upon the Capital Stock of said Company, payable on the 1st day of June, 1864, in United States gold coin, to the Secretary, or to R. T. Hill, Superintendent, Austin, Nevada Territory.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. F. HUGHES, Secretary.
23-4t Office, No. 305 Montgomery street, San Francisco.

Lady Adams Gold and Silver Mining Company, Reese River District, Lander county, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of May, 1864, an Assessment of 20 cents per share was levied upon the Capital Stock of said Company, payable on the 1st day of June, 1864, in United States gold coin, to the Secretary, or to R. T. Hill, Superintendent, Austin, Nevada Territory.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2d day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on SATURDAY, the 16th day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. F. HUGHES, Secretary.
23-4t Office, No. 305 Montgomery street, San Francisco.

Meder Gold and Silver Mining Company, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of June, 1864, an Assessment of fifteen (15) cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States Gold Coin, to the Secretary, at the Office of the Company, No. 537 Washington Street.

Any Stock upon which said assessment shall remain unpaid on Saturday the 9th day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 25th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

MILO CALKIN, Secretary.
23-5t Office, No. 537 Washington street, San Francisco.

Blue Jacket Gold and Silver Mining Company, Devils Gate District, Lyon County, Nevada Territory.

Notice is hereby given, that at a Meeting of the Board of Trustee of said Company, held on the 26th day of May, 1864, an Assessment of 25 cents per Share was levied upon the Capital Stock of said Company, payable on the 30th day of May, 1864, in United States Gold Coin, to the Secretary.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 25 day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 9th day of July, 1864, to pay the delinquent Assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

WM. A. RUST, Secretary.
22-5t Office, 212 California street, San Francisco.

Star of Nevada, Gold and Silver Mining Company, Reese River District, Lander County, N. T.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 31st day of May 1864, an assessment, of 50 cents per share was levied upon the capital stock of said Company, payable on the 1st day of June, 1864, in U S. Gold Coin, to the Secretary, at the Office of the Company, or to Ed. Muller, superintendent at Austin, N. T.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 2nd day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 16th day of Jnly, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. JOHN DUNN, Sec'y.

23-4t Office, 728 Montgomery Street, San Francisco.

Mount Eden Mining Company (Owen Ledge) Gold Hill District, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Mount Eden Mining Company, held on the 31st day of May, 1864, an Assessment of fifty cents per share, was levied upon the Capital Stock of said Company, payable on the 4th day of June, 1864, in United States gold coin to the Secretary, or to Frank Morgan, Superintendent at the mine.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 2nd day of July, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of July, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

H. B. CONGDON, Secretary.
23-4t Office, No. 320 Washington Street, (Room 3) San Francisco.

Sno Lorenzo Gold and Silver Mining Company, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21th day of May, 1864, an assessment of fifty (50) cents per share was levied upon the Capital stock of said Company, payable on the 25th day of May, 1864, in United States Gold Coin, to the Secretary, at the office of the Company, or to Daniel S. Flagg, Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on SATURDAY, the 25th day of June, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 11th day of July, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

MILO CALKIN, Secretary.
Office, No. 537 Washington Street, San Francisco. 22-4t

Blue Dragon Mining Company, Inyo District, Tulare County California.

22-1t Room 7, No. 502 Montgomery Street, San Francisco.

For Sale—A Useful Invention.—EDITORS PRESS:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a device of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test, under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-4t

Coughs and Colds.—The sudden changes of our climate are sources of PULMONARY, BRONCHIAL and ASTHMATIC AFFECTIONS. Experience having proved that simple remedies often act speedily when taken in the early stages of the disease, recourse should at once be had to *"Brown's Bronchial Troches,"* or lozengers, let the Cold, Cough, or Irritation of the Throat be ever so slight, as by this precaution a more serious attack may be effectually warded off, PUBLIC SPEAKERS and SINGERS will find them effectual for clearing and strengthening the voice. Soldiers should have them, as they can be carried in the pocket and taken as occasion requires.

Agents for California, Redington & Co., San Francisco. 23-1m

NOTICE.

THE COPARTNERSHIP IN THE BANKING BUSINESS heretofore existing between Eugene Kelly of the city of New York, and Joseph A. Donohoe, Wm. C. Ralston, and Ralph S. Fretz, of San Francisco, under the firm name of EUGENE KELLY & CO., New York, and DONOHOE, RALSTON & CO, San Francisco, will cease on the 1st day of July 1864, Eugene Kelly and Joseph A. Donohoe withdrawing from the copartnership.

The business will be settled in New York by Eugene Kelly, and in San Francisco by Wm. C. Ralston and R. S. Fretz.

Depositors are requested to hand in their books for settlement at the banking house of Donohoe, Ralston & Co.

EUGENE KELLY,
(Per J. A. Donohoe, attorney,)
JOSEPH A. DONOHOE,
WM. C. RALSTON,
R. S. FRETZ.

San Francisco, June 13, 1864.

THE UNDERSIGNED, CALLING ATTENTION TO THE above card, give notice that on and after the first day of July next, they will continue the business of the above copartnership without interruption, at the old banking house of Donohoe, Ralston & Co., in this city, under the firm name of FRETZ & RALSTON, and in New York through the agency of Messrs. LEES & WALLER, No. 33 Pine street; and that on and after the 5th day of July next, they, together with D. O. Mills, J. B. Thomas, Louis McLane, Asa T. Lawton, Wm. E. Barron, Thos. Bell, Jno. O. Earl, Wm. Norris, J. Whitney, Jr., O. F. Giffin, A. J. Pope, Herman Michels, Frederick Billings, Geo. H. Howard, H. F. Teschemacher, A. Haywood, Moses Ellis, A. B. McCreary, R. M. Jessup, Samuel Knight, A. C. Wilmerding and Wm. Alvord of San Francisco, and Jacob Korn, of Portland, Oregon, having become for that purpose duly incorporated under the laws of this State, will carry on the business of banking in all of its various branhees at the same place and through the same agency, and upon the basis of a Gold and Silver currency, under the name of

THE BANK OF CALIFORNIA.

D. O. MILLS and WM. C. RALSTON will be charged with the management of the business of the Corporation.

WM. C. RALSTON,
R. S. FRETZ.

San Francisco, June 15, 1864. 25-1m.

Segregated Crown Point Mining Company. Gold Hill Mining District, Nevada Territory.

Memoranda
FOR MINING SECRETARIES
ADVERTISING NOTICES ON SATURDAYS.

DATING OF ADVERTISEMENTS.

Assessments levied by order of the Board of Trustees of Mining Companies will be duly advertised, in strict accordance with the new law, in the MINING AND SCIENTIFIC PRESS by observing the following rules, which we publish for the purpose of assisting Secretaries in expediting their business, and avoiding the possibility of errors in regard to dates:

When the order for an assessment is made on MONDAY, TUESDAY, WEDNESDAY, THURSDAY or SATURDAY of *any week*—

THE NOTICE OF ASSESSMENT may appear on the FIRST SATURDAY subsequent to the order.

THE DAY FOR THE NOTICE OF SALE to appear may be fixed on the FIFTH SATURDAY subsequent to the order.

THE DAY OF SALE may be fixed on the SEVENTH SATURDAY, or any day (except Sunday) from that date to the EIGHTH FRIDAY, subsequent to the order.

OWING to the arbitrary provisions of the new law (the original bill of which deprived the mining public of the benefit of their choice of advertising in weekly journals), no assessment can be made upon any Friday, and the publication of the NOTICE OF SALE be made weekly in the Saturday issue of any daily or weekly newspaper. *But* ALL *Notices of* ASSESSMENT *can duly appear on Saturday*; also, Notices of Sale except in cases where the order for assessment is dated on Friday.

REVISED COPIES of advertisements will be furnished gratuitously to Secretaries who desire advertising near the mines.

ADVERTISEMENTS should be handed into the office as early in the week as possible.

Our columns are considerably wider than those of the daily papers, and consequently more words are contained in a square of our matter.

DEWEY & CO., Publishers,
Mining and Scientific Press, 56 and 57 Government House, corner Washington and Sansome streets, San Francisco.

FORM OF NOTICES—NEW LAW.

[NOTICE OF ASSESSMENT.]

Thunderboldt Gold and Silver Mining Company, Virginia District, Storey county, Nevada Territory.]

NOTICE is hereby given, that at a meeting of the Board of Trustees of said Company, held on the [4th day of April, 1864], an assessment of [twenty-five cents] per share was levied upon the capital stock of said Company, payable on the [5th] day of [April, 1864,] to the Secretary, or to John Brehard, Superintendent, at the mine]. Any stock upon which assessment shall remain unpaid on [Saturday, May 7th, 1864,] will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on [Saturday, May 21st, 1864, at 12 o'clock, M.,] to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees,

[JOHN HANCOCK, Secretary.
Office, Room 77, No. 224 Montgomery street, San Fraacisco.]

[NOTICE OF SALE.]

Thunderboldt Gold and Silver Mining Company, Virginia District, Storey County, Nevada Territory.]

NOTICE.—There is delinquent upon the following described stock, on account of assessments levied on the [fourth day of April, 1864], the several amounts set opposite the names of the respective shareholders, as follows:—

NAMES.	NO. OF CERTIFICATES.	NO. OF SHARES.	AMOUNT.
Jas. Dixoa.....	24	18	$26 28

And in accordance with law, and an order of the Board of Trustees, made on the [fourth day of April, 1864], so many shares of each parcel of said stock as may be necessary will be sold at [the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco,] on [Saturday, May 21st, 1864, at 12 o'clock M. of said day], to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

[JOHN HANCOCK, Secretary.
Office, 224 Montgomery street, San Francisco.]

A Correct Idea.

We have been informed, "officially," that the directors of several mining companies, in this city, have notified their stockholders, by circular, that all the notices of meetings, assessments, etc., relating to their several companies will hereafter be published in the MINING AND SCIENTIFIC PRESS: the only mining paper in the State, all sufficient as an advertising medium, and one eminently worthy the support of mining men and mining companies generally. We are certainly thankful for such expressions of appreciation in behalf of our efforts, on the part of the mining public, and shall continue to labor to the best of our ability, in earnest effort to benefit the miner individually and mining interests generally. We could accomplish much more than we are now doing, if our mining friends would still further concentrate their patronage upon our columns, and we think moreover that we could serve them quite as well as any other journal. Our circulation is already large and rapidly increasing. The matter given in our columns, and its typographical appearance, speaks for itself. As an advertising medium for mining notices, and such business matters as it is desirable to bring before the mining public, we believe the MINING AND SCIENTIFIC PRESS is second to no other paper in the State.

ATTENTION SECRETARIES! — The new advertising law requires mining notices appearing in the county in which the works are situated, to be published Saturdays, if a paper is published there on that day. Consequently advertisements answering the requisitions of the new law by publication in the MINING AND SCIENTIFIC PRESS, will be correct for insertion in the paper nearest the mine, in most cases. We append the section requiring the above provision, which we presume has been overlooked by some in making out their notices:

Section 6. * * * * * And also in some paper published in the County in which the works of the corporation are situated, if a paper be published therein; *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary; and *provided, also*, that if there is no paper regularly issued on Saturdays at any place where publication is required to be made, the notice may be published in every issue of the paper which is most frequently issued at such place, for the full period of four weeks.

The spirit of the new law seems throughout to be in favor of advertising all notices of assessments and sales on Saturday, and as most papers in the interior are issued on that day, the fact will prove a matter of convenience to secretaries.

The present proprietors of this journal announce with confidence their determination to render to the friends of Science, Mining and Mechanical Industry a newspaper published upon this coast worthy of their patronage at home and their pride abroad. We shall seek favors only through our endeavors to merit them.

The Editorial Department

Will be conducted with ability, in a liberal and reliable manner sparing not in expense, veneration for honesty, or respect for common sense.

Competent Correspondents

Will be employed to furnish us full and reliable information concerning newly-discovered mines; and through vigilant efforts we shall secure for our readers the latest intelligence from all important mining localities. In our list of

Occasional Contributors

We have the privilege of numbering gentlemen ranking among the most talented and experienced writers who manifest a prominent interest in the progress of Art and Science upon this coast, including the names of

PROF. J. D. WHITNEY, J. H. CHURCHILL, A. M.,
DR. T. M. LOGAN, A. B. PAUL,
DR. J. A. VEATCH, H. S. BROOKS,
REV. O. C. WHEELER, W. WADSWORTH,
M. ATWOOD, T. PRICE,
PROF. W. H. BREWER. J. E. CLAYTON.

Illustrative Drawings and Engravings

Superior in finish and useful and attractive in character, will be published from time to time, representing the most important new inventions and improvements in the art and science of

Mining and Mechanism

Developed upon this Coast. Each number of the paper will contain full and correct reports of
Sales by the Stock Boards of San Francisco.
Sales by the Stock Board of Virginia City.
Sales by the Stock Board of Esmeralda.
Sales by all Mining Stock Boards.
Reports of Bids and Sales in San Francisco.
Reports of Bids and Sales in the Territory.
A Weekly Review of the Stock Markets.
A Weekly Review of General Mining Interests.
General Summary of California Mining News.
General Summary of Mining everywhere.
Valuable Information for all Miners.
Indispensable Knowledge for practical workmen,
Practical Suggestions for inteligent artizans.

Valuable Facts and Statistics

Essential to members of all trades and professions; the best approved methods of mining; the latest discoveries and inventions in mining operations; practical, scientific views upon geological and mineralogical questions; the proper methods of reducing ores and saving the precious metals. In fact every sentence calculated to lessen the number of hard blows uselessly rendered by miners and working men, and add wealth by intelligent saving of material or labor, will find welcome space in our columns. The paper will afford many

Practical Hints

With regard to the manner of working and securing mines, derived from the actual experience of parties in our own and other countries. Also hints concerning the location and possession of mining grounds; the laws peculiar to different districts and countries; and notices of all important decisions of the law in mining cases. As a

Book of Reference

The bound volumes of the PRESS will find no rival in value to the intelligent and industrious citizens of the Pacific Coast, who cannot but feel a source of pride in the history of the inventions, discoveries and prosperous developments of the remarkable era through which we are now passing.

The Stock Record

As presented in our columns will be found correct, distinct and most convenient for preservation and future reference.

For Sending Abroad.

As a paper for mailing regularly to your friends in the East, or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

OFFICE in Government House, Nos. 56 and 57, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers,
C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides, and the evidence of any error upon our part will be received in friendship, and treated with respect.

Illinois Gold and Silver Mining Company, Smoky Valley District, Lander county, Nevada Territory.

And in accordance with the laws of the State of California, and an order of the Board of Trustees, made on the 2d day of May, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at Public Auction, at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on SATURDAY, the 18th day of June, 1864, to pay said delinquent assessment thereon, together with the costs of advertising and the expenses of sale.

GEO. C. HARRIMAN, Secretary.

23-2t Office, No. 522 Clay street, San Francisco.

POSTPONEMENT.—The above Sale is postponed by order of the Board of Trustees, to SATURDAY, the 25th day of June, 1864.

GEO. C. HARRIMAN, Secretary,

25-2t Office, 622 Clay street.

Pacific Mail Steamship Company.

THE FOLLOWING STEAMSHIPS WILL BE DESPATCHED FROM SAN FRANCISCO IN THE MONTH OF JUNE, 1864.

June 13—CONSTITUTION.....J. T. Watkins, Commander.
June 23—GOLDEN AGE.....Wm. F. Lapidge, Commander.

From Folsom street Wharf, at nine o'clock A. M., punctually,

FOR PANAMA.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company.

A. B. FORBES, Agent P. M. S. Co.,

24-tf Corner Sacramento & Leidsdorff Sts.

WANTED,
Gold Quartz suitable for Cutting Jewelry.

By FRONTIER & DEVIERCY.

437 Pine Street, San Francisco.

au31tf.

Engineer.

A situation is wanted by a competent Engineer, who is prepared to pay particular attention to all kinds of work connected with civil mining and constructing Engineering. Companies requiring a practical Engineer, Surveyor or Draughtsman will do well to communicate.

Address "ENGINEER," Office of the Mining and Scientific Press, San Francisco. 22-tf

Is is full of the most valuable reading matter. Those at all interested in mining affairs should subscribe for it at once.—*Alameda Gazette.*

It is devoted to news, art, science and progress, and should receive a liberal support.—*Solano Press.*

Terms in Advance.—Having adopted the cash system, ALL payments for subscriptions must be made in advance. If old subscribers find their paper discontinued at any time, don't stop to grumble about it, but send in the cash for another year. "Equality is Justice," and we shall administer this doctrine to all our patrons, as well as "the rest of mankind."

How to make your Remittances.—In most of the mining towns, brokers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly inclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

La Favorita Mining Company, Moctezuma District Sonora, Mexico.

NOTICE.—There is delinquent upon the following described stock on account of assessments levied on the 3d day of May, 1864, and assessments levied previous thereto, the several amounts set opposite the names of the respective shareholders, as follows:

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep21

WHEELER'S

Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

*** These Pans may be seen in daily operation at the Miners, Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

LLOYD'S NEW AMALGAMATOR

Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $40 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 6 0 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 15¾ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold.....$73 33
Silver..... 42

To the Ton.....$73 75

The assay being made by Messrs. Molitor & Co.

From 24 pounds of the same ore, worked for the same party, was obtained:

Gold.....$63 30
Silver..... 04

To the Ton.....$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $10,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 5 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 54-2 per ton; and over the works at the mill, $62 54.2 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $5.49, Silver, $1.52, amounting to $2.71-100—equal to $361.33-100 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $ 54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.

Result of 68 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 6.-00. Assay made by Messrs. Molitor & Co. 100 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58- 00—equal to $111.60 to the ton. Difference in favor of Lloyd being $104.53-100 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustel Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. etbween 3d and 4th.

And in accordance with law, and an orderof the Board of Trustees made on the 24th day of May, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on Wednesday, July 6th, 1864, at 12 o'clock, M., of said day, to pay said delinquent assessments, together with the costs of advertising and expenses of the sale.

J. F. MILLER, Secretary.

Office, No. 416, Washington street, San Francisco. 22-4t

Mechanical.

A GREAT INDUSTRIAL FAIR!

—TO BE—

Opened in San Francisco,

—ON—

THE 30TH OF AUGUST, 1864.

THE MECHANICS' INSTITUTE OF SAN FRANCISCO ARE preparing for an Exhibition of Arts, Inventions, Manufactures of Industry in general, upon a scale more grand, attractive and useful than ever before seen upon the Pacific Coast. Their Pavilion, built for the purpose, will occupy one of the city plazas, and will contain every convenience and appliance for an effective display. The Institute appeals to all persons within the scope of its influence, who are engaged in different branches of industry and art, to prepare and forward for Exhibition such articles as they, may invent, discover, or make, that are useful, instructive, curious, or suggestive. There is scarcely an occupation in life that cannot supply some article that can be so considered, and by their public exhibition they may start the genius of invention in some other branch of industry or skill, the successful development of which may greatly enrich the State. The premiums and published reports of the Exhibition will widely advertise their qualities and merits.

Each age and country has new wants, which the progress of civilization creates and ingenuity gratifies. Those of our own day and section are improved methods and machinery for reducing ores of the precious metals. A striking feature of the Exhibition will be the number and variety of these, worked by the inventors. It is hoped that information most useful to the mining interest will be elicited. Miners are invited to send ores for exhibition, and trial, in quantities sufficient to be worked seperately in the different machines, in order to test both the relative merits of the machines and the value of the respective metallic veins.

The various transportation companies of the Pacific states and territories will, with commendable liberality, transport all articles intended exclusively for exhibition, free of charge, and Wells, Fargo & Co., in like manner, will take charge of them.

All articles forwarded should be labeled—"For the Industrial Fair," and be directed to C. B. Porter, agent.

Regulations for the Exhibition.

1—Persons intending to take part in the Exhibition are requested to make known their intention at the earliest practicable period, stating the kind of article or articles they intend to exhibit, and the probable amount of space required therefor.

2—The Pavilion will be open for the reception of articles for exhibition on Monday, the 22d day of August, and will continue open for that purpose until Monday, the 29th. The Exhibition will open to the public on Tuesday, the 30th day of August.

3—The name of every article should be attached to it; also a description pointing out its merits, when thought desirable by the exhibitor.

4—When articles are entered, a check for the same will be given, which must be presented and surrendered when the articles are withdrawn.

5—Articles intended for sale will be labelled accordingly, but cannot be removed until the close of the Exhibition, except by the written permission of the President.

6—Light, fancy or perishable articles will be received, or may be removed, at any time during the Exhibition, with the consent of the President.

7—All articles deposited will be at the risk of the owners, who are invited to be present during the hours of Exhibition. In the intervals efficient measures will be taken for the protection of property.

8—On the day following the opening of the Exhibition, each class of exhibitors will meet to choose, by ballot, their own Committees of Award; failing in this for one week, Judges will be appointed by the Executive Committee. The Executive Committee will award premiums for such articles as the several judges shall decide to be worthy of the same. The premiums will be delivered as soon as they can be prepared.

9—The morning of each day, until 9 o'clock, will be appropriated to the judges, and visitors will not be admitted during that time.

10—In case of misunderstanding, application may be made to the Executive Committee, who will be at all times in attendance.

11—Steam power will be provided, that machinery of all kinds may be seen in operation; and every possible facility will be given to exhibit all working machinery to the best advantage.

12—Exhibitors or their agents will receive free tickets of admission when, in the opinion of the President, the articles exhibited by them have such value, interest, or merit as to deserve it; but the transfer of any such tickets will work a forfeit of the privileges conferred by them.

13—All communications to be addressed to WILLIAM PATTON, Corresponding Secretary.

Executive Committee.

JOSEPH BRITTON,	A. S. HALLIDIE.
H. D. DUNN,	P. B. DEXTER,
E. NUNAN,	P. J. O'CONNOR,

IMPROVED WATER-WHEEL,

—PATENTED BY—

John Tyler, West Lebanon, N. H.

GIVING THE MAXIMUM POWER WITH THE MINIMUN COST—HAVING THE FOLLOWING AS SOME OF ITS ADVANTAGES OVER OTHERS—GIVING THE BEST PER CENTAGE OF WATER USED, DURABILITY.

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 600 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,

15v8-3m Golden State Iron Works, San Francisco.

Rock Drilling Machines.

HAND AND POWER ROCK DRILLING MACHINES, FOR SALE AT 25 PER CENT LESS THAN IMPORTATION PRICES, TO PEREMPTORILY CLOSE OUT THE ENTIRE STOCK.

Also, Second hand Presses as follows: One Hydraulic Press; One Screw Standing Press; One Lithographic Press. The above presses are all in good order. WM. W. DUNN.

19-1m No. 9, First Street, San Francisco.

LEANDER RANSOM,

Civil Engineer and Surveyor,

HAVING BEEN CONNECTED WITH THE PUBLIC WORKS OF the State of Ohio for 20 years, and the public surveys of the State of California for 7 years. Also

State Locating Agent,

AND AS SUCH HAVING THE SALE OF

600,000 Acres of State School Lands.

At the low price of $1,25 per Acre.

TERMS—Twenty per cent in cash and the balance on a credit of several years.

oc7-tf Office, 323 Montgomery streets.

REYNOLD'S

Patent Cut-Off and Governor,

For Steam Engines.

127 of these Invaluable Machines

ARE NOW IN USE

In California and Nevada Territory, giving a perfectly regular motion and

Saving 20 to 75 per cent of the Fuel.

Steen's Improved Governor

IS THE CHEAPEST, SIMPLEST AND QUICKEST TO ACT AND least liable to get out of order of any Governor in use. It can be seen in operation at the Golden State Iron Works, at the Stone Breaker, foot of Montgomery Street and at the Sugar Refinery, 8th Street, San Francisco.

Steam Engines, Boilers, Pipes,

Hydraulic Presses, Shafting, Pulleys, Etc., Etc., bought and sold the best market rates.

Anti-Incrustation Powder,

A sure remedy for Scale in Steam Boilers, without injury to the Iron. In use for the past EIGHT years.

☞ MACHINERY MADE AND REPAIRED. ☜

—REFER TO—

Sugar Refinery, San Francisco,
Cottell & Co., San Jose,
L. A. Booth, Esq., Virginia City,
And 2,000 others in the United States.

E. T. STEEN.

1-tf Nos. 37 & 39 Fremont Street and 42 & 44 Beal Street.

MINERS' FOUNDRY

—AND—

MACHINE WORKS,

First street, between Howard and Folsom streets,

SAN FRANCISCO.

EVERY DESCRIPTION OF IRON AND BRASS MACHINERY, the **Best** and **Most Economical**, manufactured in the State of California, will be furnished with dispatch at the Miners' Foundry and Machine Works, as:

Steam Engines and Boilers, Flour, Saw and Quartz mill machinery Mining Pumps, Amalgamators, Retorts, Etc., Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections, designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities will be afforded ample facilities, free of cost.

All parties desiring accurate and highly finished drawings and Superior Machinery, at most reasonable rates are cordially invited to call before contracting elsewhere.

tf. HOWLAND, ANGEL & KINO.

PACIFIC IRON WORKS,

First street, between Mission and Howard streets,

SAN FRANCISCO.

GODDARD & COMPANY,

—MANUFACTURERS OF—

STEAM ENGINES & BOILERS,

QUARTZ, FLOUR, SAW AND SUGAR MILLS,

AMALGAMATING PANS AND BARRELS, MINING PUMPS AND HOISTING GEAR, WATER WHEELS,

And Machinery of Every Description.

Also furnish all kinds of Iron and Brass Casting. Only Manufacturers of the celebrated Bryan Battery. 14-tf

THE ATLAS IRON WORKS,

No. 24 & 26 Fremont Street.

—MANUFACTURE—

STEAM ENGINES, MINING MACHINERY, QUARTZ MILLS, MINING PUMPS, AMALGAMATORS, AND ALL OTHER KINDS OF MACHINERY FOR MINING OR MILLING PURPOSES.

Castings of all kinds,

Furnished. Our new and complete arrangments will enable us to do this kind of work in a superior manner and on the shortest notice.

Steam Engines of Scott's Patent,

Can be furnished of any size, and of high or low pressure. These Engines combine so many points of decided improvement in their simplicity of construction, and in the economy of fuel for running them, as to make them superior to all others. One can be seen in operation at the works, where all information respecting them can be obtained.

16v8 THOMAS SCOTT & CO.,

SAN FRANCISCO

FOUNDRY & MACHINE WORKS,

Corner Fremont and Mission streets,

SAN FRANCISCO.

ALL KINDS OF MACHINERY MADE TO ORDER ON THE MOST reasonable terms. Steam engines, high and low pressure, Quartz Mills, Saw Mills, Mining Pumps, Hoisting Machinery for mining purposes, Agricultural implements, etc., etc. Castings, of all descriptions, made to order. Also, WINE, CIDER AND TOBACCO PRESSES, of the latest improved patterns.

☞ Steam Engines constantly on hand.

Brodie's Improved Patent Wind Blast Separator for Dry Crushing, Manufactured here.

☞ REPAIRING promptly attended to.

DEVOE, DINSMORE & CO.

San Francisco, May 28, 1864. 22v8

DUNBAR'S

Patent Self-Adjusting Piston Packing.

Requires no Springs or Screws.—Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST IN friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

PIONEER FOUNDRY and MACHINE SHOP,

Lower Gold Hill,

Have Superior Facilities for Making

MINING & MILLING MACHINERY,

A COMPLETE SET OF MACHINE TOOLS WITH

PLANER,

ENABLES ME TO DO ALL KINDS OF

MACHINE WORK AT SHORT NOTICE.

RETORTS AND INGOT MOULDS,
STAMP SHOES AND DIES,
WHEELER, VARNEY AND HEPBURN
PAN SHOES CONSTANTLY ON HAND.

Plans, Specifications, and Drawings of all kinds of Mill and Mining Machinery made at short notice, by

AND SCIENTIFIC

Mining Press.

A Mining Journal--Devoted to News, Art, Science and Progress.

VOLUME VIII. SAN FRANCISCO, SATURDAY, JUNE 25, 1864. NUMBER 26.

BRIEF MENTION.

SAN FRANCISCO.

The examinntion of the thentrical mnnagers, on the charge of keeping places of amnsement open on Snnday, resnked in their dismissnl, on the ground of informnlity in the proceedings.

A deck hann on the tug hoat Merrimack, had his leg broken on Saturdny last.

A man nnmed Bloomer committed snicide nt the Enreka Lodging House, on Sunday. Cause—domestic difficnlties.

Charles W. Kramer, one of the California Pioneers, who died at Stenmhoat Springs, on the 13th inst., was hnried in this city, on Sunday, hy that nssociation.

Three men were drowned. on Wednesday afternoon, hy the capsizing of n hoat in the bny. They were workmen who had been engaged on the government defences at Angel Island, and were returning to the city at the time.

A Telegram has heen received by the Rt. Rev. Bishop Kipp, from his son, Major Lawrence Kipp, annonncing the fact that he had been wounded in one of the recent hattles in Virginia. It is supposed that the wound is not serious.

A Bio California grown ornnge. measnring 14½ inches in circnmference, has heen exhibited to us dnring the week. It is truly a monster. Tahiti mnst look to her laurels if we raise many such as this.

The Supervisors held a special meeting, on Wednesday noon, at the reqnest of the Chamber of Commerce, to take some action in regard to the Camanche. Mr. Ryan, one of the contractors, made a sintement to the effect that the delay in huilding the iron-clad is caused hy a difficulty between all hands concerned, as to the payment of $60,000.

Kate Mahon, the servant girl who was hadly hurned from her clothes taking fire, on Tuesday last, died on Wednesday.

The Fire Alarm Telegraph, for this city, is to he huilt at once. Mr. Street, who was sent Enst to exnmine the different systems, has reported in favor of the one made and nsed hy Messrs. Kennard & Co., and has heen authorized, hy telegraph, to contract with those gentlemen to huild one for us.

Mr. Thomas Brownejohn, one of onr most prominent mining secretaries, died on the 21st inst., after a lingering illness, at the Warm Springs, Alameda county. His funernl was attended, on Thursday, from St. Mary's Cathedral.

We acknowledge the receipt of an invitation from the Faculty of the Santa Clara College, to attend their Annual Exhibition and Commencement, on the 27th inst.

We would call the nttention of our renders to the card of Mr. H. Hochholzer, in onr advertising columns. Mr. H. pays particular attention to mining Engineering, Maps, Tunnel Surveying, &c., in Washoe.

The Pavillion for the Indnstrial Fair for the Mechanics' Institute of this city, was commenced on Friday. We have seen the plnns of the building nnd will in due seasou puhlish an engraving of the same, as it will appenr when finished. The contract for hnilding the Pavillion, has heen awarded to Mr. John Clark, who will complete the work within forty days. We cannot too often call the attention of onr renders, to the importance of the coming Fair, and in this connection we return many thanks for courtesies extended to ns hy the officers and members of the Institute.

Prospecting Expedition.—The prospecting expedition which recently left Stockton, under the direction of Dr. Willing, for Arizona Territory, has heen heard from, on West Walker's River, near the head of the Stanislaus. The party had found what appeared to he some very good silver croppings at that locality, and sent in some specimens. The vein is about forty feet wide. The Dr. also sent in a specimen of ore which he thinks contains tin. The party is provisioned for an eight months' trip, and their ultimate destination is Arizona Territory and the land of the "golden hullets."

The Goln Bill.—An evening paper asks, "What means the Gold Bill?" We answer that the government, feeling itself strong and powerful, has determined to check this thing called "Gold Speculation," which, to quote the language of an eastern paper, "is contrived and engineered hy great foreign capitalists, who have combined to invest heavily in our puhlic securities and who naturally seek to buy them as cheap as they can." *That's what's the matter.*

A Sanitary Festival will he held at Allison's Ranch, near North San Juan, Nevada county, on the 4th of July. The Hon. Wm. H. Sears will deliver the oration and the San Jnan Gnnrds, do the military honors. The day will be wound up with a military hall at French Corral. The receipts of the whole day will he donated to the sanitary fund.

Treasure Shipment.—The Uncle Sam took away, on Thursday $982,380 in treasure.

Rules for Advertising Assessments on Saturdays.

Levy your Assessments upon any day Except Friday.

Advertise the Assessment Notice on the First Four Saturnays succeeding the day upon which the assessment is levied.

Appoint the day for advertising the Delinquent Sale on the Fifth Saturday succeeding the date of levying the assessment.

Appoint the Day of Sale on the Seventh Saturnay succeeding the date of levying the assessment, or on any dny previous to the Eighth Saturday.

Assessments ordered upon Saturday, afford the Secretary the longest term in which to effect his advertising at the mine.

Election of Officers.

The following companies at their recent meetings hnve elected officers as follows:

Ontario and Webster G. & S. M. Co.—Meeting June 20. Trustees, J. B. Levet, W. H. Hyde, H. Chester, W. H. Delano, Edward Fales.

Green G. & S. M. Co.—Meeting June 9. Trustees, Edward Flanagin, Capt. John Henderson, J. R. Jarbor. President, Capt. John Henderson; Superintendent, Capt. Uhalahand.

Gobernanora S. M. Co.—Meeting, June 20. Trustees, Geo. C. Wallar, R. G. McClellan, W. A. Ahhott, J. Brazer, T. Prince. President, and Trensurer, Geo. C. Waller; Superintendent, G. W Hayden,

New Year's Digoinos G. & S. M. Co.—Meeting June 21. Trnstees, M. Lebatnrd, E. Altenburg, B. Lagonrde, C. S. Lipman, C. Desprey. President, M. Lehatard; Vice President, E. Altenhurg; Secretary, Ang. Knnast; Treasurer, B. E. Auger.

The Bank of California.—This institution, which will snpply to the financial circles of this city a reliahle hanking medium long needed hy nll whose means or husiness lead them into the vortex of financial matters, has started npon as sound n basis as any enterprise of the kind ever yet horn on American soil. The amount of cash capital paid in (in gold) is $2,000,000. We append the 2d Section of the Certificate of Incorporation, and the names of the incorporators, among whom will he fonnd many of the solid men of San Francisco:

Second—That the ohjects for which the Company is formed are to engage in and carry on the business of hanking to such extent, and in nll such branches as may legally be done under the Constitution and laws of the State of California.

Incorporators—D. O. Mills, J. B. Thomas, O. F. Griffin, J. Whitney, Jr., Herman Michels, Moses Ellis, R. M. Jessup, W. E. Barron, H. F. Teschmacher, Louis McLane, A. C. Henry, W. C. Ralston, A. T. Lawton, John O. Earl, William Norris, A. B. McCreary, A. J. Pope, R. S. Fretz, Thomas Bell, George H. Howard, Samuel Knight, J. C. Wilmerding, William Alvord.

Gone East.—A large number of Californians left on the steamer of Thursdny last, to visit their old homes in the East. Among the passengers was Frank Warnell, latel the Editor of the Mining Gossip department of this paper, who goes East for hoth husiness and pleasnre. While our readers will donhtless miss his piquant articles in that department, they will be glad to learn that he will correspond with us from the Atlantic side. *Bon Voyage*, Frank.

The North Potosi and Chollar.—A correspondent, writing from Virginia City, says that much excitemeut exists there with regard to the suit pending hetween the North Potosi and Chollar companies. It is thonght that much violence may grow out of it.

Miss Emma Hardinge is to deliver the oration Indian Valley, on the 4th of July.

Written for the Mining and Scientific Press.]

The Patio Amalgamation.

BY J. H. CHURCHILL, A. M.

[CONCLUDED FROM PAGE 410.]

This change from the suboxide to the higher oxide of mercury, and metallic mercury, by the action of the light, or a temperature of 212° was long since noticed in the laboratory. It has a counterpart in the reduction of the insoluble salts of the suboxide of mercury, when exposed to long boiling with water. Berzelius acknowledges the authority of chemists, ranging from Boerhaave to Herapath, for the change of finely divided mercury, well agitated in contact with the air, into suboxide, but adds to their experience the observation of his own, that the reaction only takes place when the mercury is impure. His words are these, after speaking of Boerhaave's method, by fixing a flask a quarter filled with mercury to a revolving wheel, he adds, "Many other chemists having obtained this oxide by this means I shall not deny the correctness of the fact, but it is nevertheless perfectly true, that with absolutely pure mercury, the experiment only succeeds when some foreign matter is interposed between the molecules of the agitated mercury, and prevents their junction again." He compares the result with the voluminous black powder, obtained by agitating mercury containing lead. "Let the lead," he says, "be put in a mortar and pounded with the pestle, and as soon as the pellicle of suboxide of lead is broken up, which kept them apart, thousands of globules of mercury spring out of it."

Trituration then with sand, to act as a subdivider, being an efficient agent in the production of the powdered oxide "this amalgamates instantly with any brass, gold, silver, &c., with which it may be rubbed."* It is well to recall here that the upper portions of the torta, which have been the most exposed to the oxygen of the air, and the light and warmth of the sun, are constantly found to be the most forward, when separately tested, and that a long continued application of a lower degree of heat may substitute a higher temperature.

The introduction of oxygen, in this unstable form, appears to me of much more importance, in accounting for the phenomenon of the oxidation of sulphurets discovered by Dr. Bowring, than when it combines with the subchloride of copper, to form, as it does, the oxichloride. The combination of a salt of copper with the oxide, formed one of the most durable of the ancient green pigments.†

Having brought thus far the narrative of the employment of the chemicals, and noticed the necessity of having their reactions under control, I will now consider the different counter agents used to modify their effect. For this purpose the principal resource is lime, which is employed to prevent the liberation of hydrochloric acid from the salt, when too much magistral has been added at any time. This being itself injurious, when too much is used, and as may be gathered from what has been said of the proportions employed, there being very little guide to be found except in testing the result from time to time. It has been more than once attempted to substitute the lime by metals. These involve further reactions according to the proportion of other metals present.

The use of wood ashes in the place of the lime probably has never been of more than limited extent; the alkali they contain becomes as neutral and free from secondary action as an equivalent quantity of lime. An excess also acts directly upon the sulphuric acid of the magistral, and the salt pro tanto remains unaffected. The metals used directly for this purpose have been copper and zinc, in Mexico. The beneficio de hierro of Pern may have partly been directed to the same end—at any rate the principle of subjecting other materials, than the precious metals and mercury, to the action of the excess of acid is attained in all three modes. Louckner and Macintosh patented the use of copper amalgam in Mexico. Their claim was evaded by the practice of introducing copper, precipitated by iron from a solution of sulphate of copper.

It will at once be seen how early the Patio practice was complete, even if not thoroughly understood, when we observe that, whether the sulphate of copper was dissolved, and treated with iron outside the torta, and the precipitated copper introduced as such, or, when farther operated on, as amalgam—or the magistral was introduced in this state to the torta, and there made to act on the salt with, as a result, chloride, or subchloride of copper, according to the other materials present, and the iron afterwards brought into the solution of one of these salts—we shall equally have this finely divided copper. Copper has little tendency to combine with mercury, except when this is precipitated by decomposition on its own surface—or it is made to unite by electrical action—unless it is rubbed with the mercury when itself reduced exactly to this form. This increased predisposition of copper, thus obtained, for amalgamation, is of the same nature as its tendency to form chemical combinations; and while this was as we have seen the result of the practice of the Peruvian miner of 1586, the amalgam itself was the patented invention of one of the most experienced amalgamators of recent date, in Mexico. The amalgam employed contained about thirty per cent. of copper. The proneness to oxidation of freshly precipitated copper will also appear of importance.

It has been observed that the copper disappears from the amalgam, and that there is less loss of mercury, when the copper amalgam is used, even before the chemicals are brought into action; thus when in amalgamation of native metals in the arrastras, copper amalgam has been substituted for the silver amalgam before spoken of, this has resulted. It is to be assumed therefore that the finely precipitated copper operates to facilitate the combination of the precious metals with the mercury, with which it first itself unites; and when this is in the presence of chloride of silver, it may even be regarded as affording much the same readiness for an interchange, as in the case of the mutual decomposition of salts. Zinc amalgam which could be much more readily made, has also been used, and would have the same effect, as far as counteracting excess of magistral in the torta. Its action in other respects, like that of iron, would be less favorable to obtaining a pure amalgam. This result is equally obtained in the barrel amalgamation, indeed the following observations, made by Mr. Kustel, import that not only does the copper then ensure immunity from amalgamation with the base metals already in the ores, but that impure copper is also effective there, he says. "It is by no means necessary to use pure copper in the barrel. In treating the copperous silver ore from the Heintzelman mine in Arizona, I was obliged to procure copper by liquation of copperous lead. Being limited in regard to heat for want of firebrick the copper could not be refined properly, having a grayish color on account of some lead." Nor was this a single case of the kind—for again he says "black copper bought from Mexicans gave a very favorable result as to the quality and quantity of the silver extracted." I have alluded to the reduction of the insoluble subsalts of mercury, by the long continued action of boiling water, as analogous to the change of the suboxide, to the protoxide and metallic mercury, by the action of the sun—and, as we have also seen, there is at the stage of the process when the torta is in good working order a formation of calomel, the subchloride of mercury, which takes place in the presence of common salt. A great tendency exists in this to form a double salt with the protochloride of mercury. To this double salt have been traced cases of accidental poisoning when the druggist's calomel has been administered with common salt. This tendency will of course induce a change of the subchloride of mercury to the latter chloride, but here again we have ground for tracing the utility of finely divided copper, as it would oppose itself to the above reaction. This combination of the chlorides present is not confined to the common salt and mercury, and the common salt and silver, but there is formed also chloride of copper, and I have only to refer to the experience of every chemist, who uses wet methods of analysis, to draw attention to a point which in connection with the Patio process has hitherto been unnoticed by writers on this subject. I mean the solubility of the chloride of silver in the chloride of copper.

In attempting a summary of the theory of the Patio Process I will first enunciate the reactions which are traced in it by the hand of M. Regnault in his teachings at the Ecole Polytechnique of Paris. Notes of his lectures furnish the following. "The seasalt and the sulphate of copper of the magistral react on each other by mutual decomposition, thence is formed protochloride of copper, Cu Cl, and sulphate of soda. The metallic silver decomposes the protochloride of copper, leads it back to the condition of subchloride of copper, Cu^2 Cl, and itself changes to chloride of silver. The subchloride of copper dissolves in the solution of seasalt, and reacts on the sulphuret of silver, and forms sulphuret of copper and chloride of silver. The mercury acts in its turn on the chloride of silver, which also dissolves in the solution of seasalt and forms subchloride of mercury, Hg^2 Cl. and the metallic silver combines with the rest of the mercury. It is essential in this operation, as in the amalgamation at Freiberg, that there remain no free protochloride of copper, Cu Cl, since this chloride would increase the loss of mercury by relinquishing half of its chlorine to this metal to transform it into the subchloride of mercury, Hg^2 Cl. The subchloride of copper, Cu^2 Cl, exercises no injurious action." We are indebted to Boussingault, another French chemist well known in Mexico, for determining that beyond the reaction above detailed between metallic silver and the protochloride of copper Cu Cl—there is also another which will take place between two equivalents of this salt and one equivalent of the sulphuret of silver directly, producing chloride of silver. Karsten the eminent German metallurgist traced as the result of the reaction between the protochloride of copper the separation of the sulphur from the sulphide of silver without its combining with the copper. Napier has shown the formation of sulphide of mercury, by simple division of the two elements of the sulphuret of silver, the mercury combining with both the sulphur, and the silver. This reaction is however confined to a very small proportion of the materials present and is perhaps mainly to be attributed to friction, as it was traced by him in the arrastras. Two of Dr. Bowring's experiments appear to me of sufficient importance to be given with some detail.

1st. He beneficiated an ore of silver, containing the sulphuret of that metal, with salt and some protochloride of copper, Cu Cl, he then treated the mass with pure water and from the filtered washwater obtained a precipitate with nitrate of baryta. The sulphate of baryta found was estimated as indicating the oxidation of the whole of the sulphur to sulphuric acid—he says "the presence of the oxygen without doubt resulted from the absorption of this gas by the subchloride of copper, Cu^2 Cl." I have already pointed out a reason for doubting the efficiency of this agent to transfer the oxygen it absorbs, and have indicated the mercury and copper as possibly being the active cause, but I have not verified the production of sulphuric acid in this way. Again he amalgamated silver ore with bichromate of potash and sulphuric acid thus liberating oxygen in contact with the ore and mercury, and he obtained as a result amalgam of silver, and he hence inferred that "in the same way any materials which produce oxygen may serve in the amalgamation," but independently, aside from this direct induction, he offered it as a proof that chloride of silver was not formed in the torta at all. It is to the discussion, arising from this attempt to call in question the long received theories of this process, that we are indebted for the experiments of Mr. Napier, which applied the previous results of M. Malaguti & Durocher to proving that, in the mixtures of such ores as are found in the torta, the chloride of silver may be formed in a sufficiently large quantity to be readily and uniformly detected, and then may afterward disappear—and this quite independently of the action of mercury. The most important details of this we have already traced in the former part of this description. In view however of Dr. Bowring's determination of the oxidation of the sulphur of the sulphuret of silver, given above, Mr. Napier's test—heating samples from the tortas in a solution of common salt—would appear less happy, when he is wishing to prove directly, that the above assumption, of the absence of chloride of silver, is false.

If we now resume the examination of the routine of the process, we shall be in a position to see the bearing of the intricate mixtures, which constitute the torta—it is important to observe that, however much care may be taken to effect the due commingling of the various materials, yet many causes conspire to make the full accomplishment of this result tedious, and to produce the occurrence of reactions, which prevent the progress of the amalgamation according to any rule, which can be absolutely laid down beforehand—the time requisite to dissolve large quantities of materials, for it is of masses of thirty to sixty tons of which we are speaking—the unfavorable temperature, for it is in hot solutions of salt, or chloride of copper, that chloridee and especially chloride of silver readily dissolve—the large proportion of neutral materials, the gangue of the ore—the silica introduced with the magistral—all preventing the contact of the active ingredients, except as they gradually become dissolved or are accidentally brought together—the necessary dependence of the succession of different series of reactions on the proportions thus acting on each other, which in different parts of the torta must be very various, and consequently irregular—the action of the law now well established that deductions cannot be drawn, from the affinity of the strongest acids for the strongest bases, as to the arrangement of substances in solution—and indeed from the commencement, the varying quality of the ores themselves. These all render it impossible to define with exactness the progress of the silver, from its combinations with sulphur, with silica, with manganese‡—and associated as it may be with mercury, antimony, arsenic, zinc, lead and copper—to that

honeycombed mass of white metal which fixes the imagination of the nzoguero as he thinks of the plata pinu which is to be the goal of his cares.

If I have shown why the treatment of this subject cannot be exhaustive, I shall rely upon the indulgence of the readers of this paper, if I have succeeded in pointing out those reactions which may be suggestive of further progress. This has been my aim, as fulfilling the true function of chemistry.

The Copper Mines of Plumas County.

Editors Press:—I have passed a fortnight very pleasantly and very profitably among the mountains of Plumas, finding everywhere throughout this section, evidences of the most abundant mineral deposits. The gulch and placer diggings are still energetically worked, affording sure and reasonable compensation. The quartz ledges, bearing gold, are being profitably worked. One ledge, which pays the least per ton of any having a mill upon it, (averaging but $8,) is proving a very valuable property; wood costing nothing here, and labor being reasonable. The running expenses here, per ton, for working rock, will not exceed $2.

The copper mines of this region are marvels of richness and size. One which I have visited has croppings 125 feet wide, and at the depth of 25 feet exhibits six feet of decomposed quartz, literally stuffed with decomposed copper, and over seventeen feet of solid yellow sulphurets of high grade. I have never seen its equal as a copper mine, and I much doubt if its superior can be found anywhere. I ought to have said that the extent of the vein is being determined by drifting from the shaft sunk on the vein, and that neither the foot nor hanging wall have yet been reached. The formation is granite and slate. The Superior mine shows beautiful "peacock ore" in large quantities. The Summit mine exhibits sulphurets, grey oxides and native copper. The "Gift" and "Price" claims give promise of great excellence. The great richness of the mines of Plumas county, the cheapness with which they can be worked and the magnificent agricultural resources of the region, must convince the capitalist, who investigates carefully, that nowhere in the state would an investment be more certain to prove remunerative than in extracting the precious and useful metals from the everlasting hills which overlook Feather river and its numerous branches.

Prospector.

Taylorsville, Plumas Co., June 17.

The Return Tide.—An exchange says that the return tide of population from Washoe seems to have set in pretty strongly. Hundreds who left here a few months ago, in expectation of finding better employment on the other side of the mountains than on this, are returning to the scenes of their former labors, out of pocket, and almost out of heart. Some are so poor that they are compelled to foot it, and live on half rations. Luckily, however, there is pretty general demand for laborers in the mining, and some of the agricultural portions of this State, and the places they left in disgust now appear to them as paradises. The diligent and faithful, who are determined to work, can always get employment in this State at good wages, but hanging about barrooms in cities and towns is no way to get work.

Photographic Discoveries.—A Spanish photographer has discovered a varnish which gives an astonishing brilliancy to photographs to which it is applied. He keeps his invention secret, but the varnish is believed to consist of albumen. M. Matthys has also produced a similar effect by means of a thin coating of collodion.

Photographs are now taken very successfully by the aid of the new magnetism light. Fifteen grains in the form of fine wire will burn a minute, and not cost more than a few cents. At the distance of eight feet from the sitter the light produces a negative equal to any obtained from sunlight under the most favorable circumstances, and by moving the light the harshness of the shadows and a distribution of light and shade are completely at the control of the operator. This opens a new page in photography.

THE MINES OF THE SIERRA NEVADA.

THEIR FORMATION AND EXTENT.

When the mind once becomes familiar with the laws of matter, and the forces by which lofty ranges of mountains are piled one upon another, it is enabled to perceive analogies in their formation and structure which otherwise would not be obvious. In order to comprehend the formation of the Sierra Nevada mountains, certain facts must be borne in mind, that by most geologists are considered well established. *First:*—The interior of the earth is a mass of molten matter, at a very elevated temperature. *Second:*—The earth was once vastly more bulky than it is now, extending far above the clouds or even the present line of the atmosphere itself; and this in consequence of a vastly higher temperature than that which, in the present era, it possesses. *Third:*—The force by which mountains are upheaved is derived from the contraction of the body of the earth by the loss of heat, thereby leaving its crust too large.

The contortions, the bends, the inflections, the ever recurring rises and falls of the more ancient stratified rocks, forcibly remind one of the foldings of a loose robe, grown greatly too large for the shrunken body it contains. The crust of the earth was once too thin to support an island above the surface of the sea; and at a time still more remote, the temperate of the globe was so high that no water rested upon its surface. When the earth was one molten mass from center to circumference, the matter of which it is composed arranged itself in successive layers, according to specific gravity: the lighter earths upon the surface, and the heavier earths and metals near the earth's center; subject, however to the modifying influence of heat. The rocks and metals do not expand equally by an increase of heat. Were it otherwise, no metals would as yet have found their way to the surface through the fissures. The figures in the following table, the results of experiments made on building materials, will show the relative increase in bulk of a few specimens of rocks and metal, for an increase in temperature of 180° Fahrenheit:

Granite	.0008968.	Cast Iron	.00114676.
Greenstone	.0008089.	Copper	.00169920.

The above table, compiled from a marginal note in Dana's Mineralogy, though limited, is sufficient to indicate that earths and metals do not expand equally by an increase of temperature. I will here suggest a method by which I think the order of the formation of the igneous rocks may be determined to the entire thickness of the earth's crust. Let a series of experiments be instituted to ascertain the exact specific gravity, at a fixed temperature, of all the igneous, unoxydized rocks and metals, and also their rate of expansion at an increased temperature. As gold and quartz rock expand unequally, by an increase of temperature, the degree of heat might thus be determined at which the specific gravities of the two bodies are equal, and their place in the formation of the earth's crust, might also be fixed. By this process the places of all the igneous rocks, and the metals they contain, may be determined in the order they occur, from the aqueous, or stratified rocks, downwards. Specimens of every strata may be found in the fissures produced by each successive upheaval, the matter filling each fissure being a chimney, reaching up from each stratum, and identical in composition. As the temperature of the earth decreased, its crust thickened, so that the molten matter filling each fissure came from a greater depth at each upheaval.

An exact knowledge of the structure and composition of the earth's crust would lend increased interest to science; [and in its practical results would be of incalculable benefit to the miner. When the crust of the earth adjusts itself to the shrinking mass it contains, earthquakes are produced, and as the crust shortens, certain portions are elevated, causing fissures, which, along the summit of such elevation, open upward and outward, and along the base, open downward. As the crust of the earth thickens, the width of such elevation increases at each successive upheaval, until ranges of mountains are formed. As the gold bearing stratum lies beneath the iron, copper and silver bearing strata, the mountains must have attained great height and breadth before gold bearing rock could have found its way to the surface, through the fissures. It is evident that when a fissure opens at the summit, another must open at the base at the same moment, (or very soon after) and consequently the matter filling both fissures must be identical in composition, having come up from the same stratum. When gold bearing quartz is found upon the summit of a range of mountains, it must also exist in the fissures at the base of the range. For the sake of distinction, I shall denominate that system of copper, silver and gold bearing quartz lodes, situated at or near the base of the Sierra Nevada range of mountains and running parallel with the axis of their greatest elevation, *true fissure lodes;* and all other quartz lodes, whether productive or otherwise, running at an angle with the system of true fissure lodes, *segregated lodes*, as in reality most of them are. During upheavals, the lateral pressure, at the base, against the upper edges of the fissure, produced by the entire weight of the mountains is immense. Although these fissures may reach their entire length, yet, owing to the looseness of the surface, they only appear at intervals in favorable localities. Segregated lodes are richest at the surface, because the matter of which they are composed was ejected by the instant closing of the semi-fluid portion of the underside of the earth's crust, while true fissure lodes, being narrowest at the surface, increase in richness until the stratum is reached of which they are a part or chimney. True fissure lodes are poorest at the surface, because the moment when the molten matter begins to rise in them, its temperature falls, which makes a difference in the specific gravity, of the gold and quartz rock, that of the gold being greatest, it sifts down through the quartz until they solidify. The immense quantity of gold produced by the placers of the summit, was derived from the segregated lodes that have disintegrated and wasted away. The fact that the system of summit lodes has been so immensely productive surely indicates that the system of true fissure lodes will also be productive, as both systems were formed simultaneously and must have been filled with matter from the same stratum, identical in composition. The true prosperity of California will date from the opening of these as yet unexplored mines, which from their nature are inexhaustable.

The product of all the mines the world has yet known would dwindle into insignificance in comparison with the yield of the system of true fissure lodes, existing at the western base of the mountains, when they are developed. Judging from the structure of the western slope of the Sierra, every metal known to man, should be found in the lodes existing at their base. All of these quartz lodes containing any gold at all in the surface rock, are worth looking after. They should be followed down, below the point where any lateral pressure existed during the upheavals, or until the lode widens and holds its width before they can be considered prospected. The scope of country containing these mines is about six or eight miles in width, and should extend the entire length of the mountains. I would say to all of those miners who from the transient nature of placer mining have become despondent, be of good cheer, for there is enough for all. "There is a good time coming, boys." The spectacle of dilapidated, clapboard mining camps will not be repeated in the many towns that will inevitably spring up along the foothills, for the basis of their prosperity will be as enduring as the everlasting hills. F. A. H.

Forbestown, Butte County, Cal.

Insuring Sermons.—A Connecticut clergyman some ten years since, insured a large lot of manuscript sermons, among other personal property, in the well known Etna Insurance Company at Hartford. In moving from one house to another, the sermons chanced to be left as the last of his effects to be moved, and in the mean time the house he was leaving, suddenly took fire, and was destroyed, together with the old sermons. On application, the insurance money was refused on the ground that old manuscript sermons, not intended for publication, were of no value. In his defense the clergyman introduced, as witnesses, some of his parishioners who testified that the sermons had done *them* some good and they hence believed them valuable. The Judge could not decide upon their pecuniary value, but the jury, thinking it was sufficiently proved that they were "some good," awarded a verdict of $2,000 for the plaintiff.

It is said that there are between eleven and twelve millions of the inhabitants of France whose poverty is such that they are unable to taste butcher's meat from one year's end to another.

THE NEW ASSESSMENT LAW.

Tbc report of the following Act, given hy the daily press about the time of its passage, contained aome slight errors, and we tberefore republish tbe law as presented in the official "Statutes of California," Chapter 344, page 404 :—

AN ACT Concerning Assessments upon the Stock of Corporations.

Tbc people of tbe State of California, represented in Senate and Assembly, do enact as follows :

Section 1. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for tha purpose of paying the proper and legal expenses of such corporation, assessments npon tbe capital stock tbereof, in the manner and form and to the extent hereinafter provided, and not otherwise.

Section 2. No assessment sball exceed five per cent. of the capital stock of the corporation, and none sball be levied while any portion of any previous assessment sball remain uupaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with tbe terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of n previous assessment against one or more stockholders, restrained hy injunction or otberwise ; in which case, further assessment mny he levied and collected according to this act.

Section 3. No assessment sball be levied except hy order of the Board of Trnstees, concurred in hy a majority of said Board, and entered npon the records of the corporation.

Section 4. Every order levying an assesment sball specify the amonnt thereof and the time when the person or persons to whom and the place or places where tbe same is payable. It shall also appoint a day for tbe advertisement of the delinquent list, whicb sball not be less than tbirty nor more than thirty-five days from the time of tbe making of sucb order, and a day for the sale of delinquent stock, which shall not be less tban ten nor mora than twanty days from the time appointed for tbe advertisement of the delinquent list.

Section 5. Upon the making of such an order, tbe Secretary sball cause to be published immediately a notice thereof in the following form :

" [Name in full.] [Location of works.] Notice is hereby given tbat at a meeting of the Trustees of said Company held on the [datc] an assessment of [amount] per share was levied npon the capital stock of said Company, payable [when, to whom, and wliere, particularly]. Any stock upon which said assessment shall remain unpaid on tbe [day fixed] will be advertised on that day as delinquent, and nnless payment sball be made before, will be sold on the [day appointed], to pay tba delinquent assessment, together with costs of advertising and expenses of the sale. [Signature of the Secretary, witb particular location of office.]"

Section 6. Said notica sball ba published once each week for four successive weeks, in some daily or weekly paper, published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the County in which tbe works of the corporation are situated, if a paper be published therein ; *provided*, that if the works of the corporation are not situated within some State or Territory of tbe United States, tben publication in a paper of the County shall not be necessary ; nnd, *provided also*, tbat if there is no paper regularly issued on Saturdays at any place where publication is required to he made, the notice may he published in every issue of the paper which ia most frequently issned at such place, for the full period of four weeks ; and *provided, also*, that if tbere is no newspaper publiabed at tha place dasignated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto ; and, *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of auch service upon all the stockholders of said corporation, tben no notice by publication sball ba necessary, and auch personal notice shall be deemed complete.

Section 7. If any portion of the assessment mentioned in said notice ahall remain nnpaid on the day spacified therein for the publication of tha notice of aale, the secretary shall, nnless otherwise ordered by the Board of Trnstees, cause to be published in the same papers in which the notice provided for in section 5 shall have been published, a notica substantially in the following form :

" [Name in full ; location of works.] *Notice.*—Thera is delinqnent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previons tbereto, if any,] the several amounts set opposite the names of the respective sharebolders, as follows : [Names, num ber of certificates, number of shares, amount.] And in accordance with law, [and an order of tbe Board of Trustees, made on the [date,] if any such order shall have been made,] so many shares of each parcel of said stock as may he necessary, will he sold at the [particular place,] on the [date,] nt [the hour,] of said day, to pay said delinqnent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary witb particular location of office.] "

Section 8. Said last named notice sball state every certificate of stock separately, with tbe nnmber of sbares which it represents. and the amount dne thereon, except wbere certificates may not have been issued to parties entitled thereto, in wbich case the number of shares and the amount due thereon, together with the fact that the certificates for such shares bave not been issned shall be stated.

Section 9. Said notice, wben published in a daily or weekly paper, or in both, shall be published as follows : Wben published in a daily paper, the same sball be published for a period of ten days, exclnding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall he published for two weeks previous to the day of sale, tbe first publication in tbe weekly being at least fonrteen days prior to the day of sale.

Section 10. By the publication of the said notices as hereinhefore provided tbe corporation shall acquire jurisdiction to sell and convey a full complete, and absolute title to all of the stock described in the notice of sale upon which any portion of tbe assessment or costs of advertising shall remain unpaid at tbe hour appointed for the sale, but shall sell no more of such stock tban is necessary to pay the assessments due and cost of sale.

Section 11. On the day and at the place, and as nearly as may be nt the hour appointed in the notice of sale, the Secretary shall, unless otherwise ordered hy the Board of Trustees, sell, or caused to he sold at public auction, to the highest bidder for cash, so many sbares of each parcel of said described stock as may he necessary to pay the assessment and charges thereon, according to tbe terms of said notice of sale ; *provided*, tbat if payment be made hefora the time fixed for sale, the party paying shall only he required to pay the actual cost of advertising.

Section 12. The person offering at such sale to pay the assessment and costs for the smallest number of sbares, or fraction of a share, shall be deemed tbe highest bidder.

Section 13. The times fixed in any notice published according to the provisions, [of this Act] may be once extended for a period of not more than ten days, by order of the Board of Trustees duly made and entered on the records of the corporation ; hut no order extending the time for the performance of any act specified in any notice sball he effectnal, nnless notice of sucb extension or postponement be appended to and publisbed with tbe notice to which [the] order relates, before the completion of the regnlar course of publication thereof.

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be per formed in order to enforce the payment of the same ; hut in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall bc void, and publication shall be begun anew.

Section 15. All acts and parts of acts inconsistent with the provisions of this act are bereby repealed ; provided, that such repeal shall not affect proceedings commenced for tbe collection of assessments heretofore levied, hut all snch assessments may be collected in accordance with the provisions of the laws tben in force.

Section 16. Tbis act shall take effect immediately.

Appproved April 4th, 1864.

The Immense Line of Immigration.—The Virginia *Union* says : A gentleman who has just arrived from the East by the way of the overland stage. bas been telling us of tbe immensity of emigration on tbe way to this country. He says tbat the nnmber of wagons and people is astonisbing. He found the Platte river so high that tbe wagons could not be taken across. At Juleshurg, a crossing place, he counted above six hundred wagons ; and he is confident, that if all the wagons which he saw on the route were placed in a line, they would extend from Julesburg to Atcbinson—n distance of about four hundred miles!

There waa a very heavy frost at Nevada City, on Friday morning.

WASHOE.

The Dardanelle Company will have their hoisting works ready in a few days. They will be driven by a 20-horse power engine.

The Pride of America are supposed to he close upon the ledge in the drift they are now running. Considerable quartz is already found in numerous small feeders, from which fine specimens are obtained.

The Oneoto Company bave struck a large quantity of water in their tunnel, whicb in addition to what they already had gives quite a stream running from tbeir tunnel. A good deal of quartz is found in the rock through whicb the water rushes into the tunnel. Some think this is a ledge, and it is tbe intention of the company to run a drift along it to prospect it more thoroughly.

Gentle Annie Co.—This company has sunk n sbaft to tbe depth of 135 feet. The ground is of such a character that work can be carried on very rapidly. The company contemplate putting up a whim for boisting.

The Cole Company, a Cedar Ravine claim, have their tunnel in 710 feet, and are at present engaged in putting a box for air under the track, for ventilating purposes.

The Kenosha.—Tbis claim, upon Cedar Hill, consists of 2,400 feet. A prospecting shaft has been sunk to the depth of 124 feet, a little north of the Sierra Nevada hoisting works. At this depth the ledge has a width of from three to four feet, and is almost exclusively of a gold-bearing character, and is, or rather will be, worked only for that metal. Some ten tons were lately sent to tbe Desert mill in Carson Valley. The returns are looked for shortly.

More Roasting Furnaces in Washoe.—Two large double roasting furnaces are being erected at the Woodpecker Mill, immediately below Dayton, N. T. At Keisel's Mill, above Dayton, similar furnaces are also being erected. Keistel & Co. are also building a new steam mill n short distance above the one they are running at present. It will contain fifteen stamps.

About to Start.—A new water-mill wbich is being built by Mr. Jones of Silver City, N. T., is nearly ready to go into operation. It stands in the southern part of the town, on Gold Cañon, and will be propelled by a 24-foot wheel. It will contain three stamps, one seven-foot amalgamating pan and a large agitator.

Precious Metals in Missouri.—Recent explorations go to sbow tbat Missouri is as rich in the precious and rare minerals, as she is in the more bulky, less precious, but more useful minerals. We clip tbe following from a late number of the Missouri *Democrat* :—

The collections on display at our great Fair are "confirmation strong" as visual sense can make, that gold, silver, tin, cobalt and bismuth are among the rare minerals which are found in our State, in moderate, if not paying quantities. It is only within a very short time, however, that these rare gems, which since the invention of poetry, have formed the only fit companion with the bright eyes of the best portion of creation, yclept "diamonds," were known to exist, *in situ*, within our borders. The precious stones can be seen in the Jewelry Department of the Fair ; and a letter before us from Mr. J. Doutlinger, of this city, to Brigadier General Fisk, commences thus : "*General* :—Attached to this, you will receive a little box containing twenty-one diamonds, for the benefit of the Mississippi Valley Sanitary Fair, which diamonds I have found here in Missouri. Although raw (not polished, for there is no chance on this continent, to get precious stones polished,) they will find buyers both for their value, as well as novelty. They have been tried by Theodore Weiss, analytical chemist of this city, and proven genuine. It is most gratifying for me to have succeeded in this discovery ; and that, after a most discouraging answer from Professor Swallow, State Geologist of Missouri, more than seven years ago, to the effect that 'neither gold nor any other precious mineral could be found here in Missouri.' Now, we have diamonds, and we have the gold, and the latter, are, I have every reason to believe, in great abundance."

Fall of a Bridge.—The wire suspension bridge tbat spans the South Fork of the Mokelumne River, on the road leading from Mokelumne Hill to West Point, fell, a few days since, carrying sixty head of cattle tbat were on it, along. The bridge was fifty feet high, and all the cattle were killed.

Two fine crops of hay will be raised in tha tnla lands of tho San Joaquin Valley this season.

EDUCATION vs. LEARNING.

Learning is one of those things which, despite the progress that has been made in almost everything else mundane, has continued unaltered, in all its essential particulars, almost since civilization began. The same class of instruction is given to young men now, and much in the same manner too, as it was imparted before the English language had an existence. Then as now, learning consisted mainly of a knowledge of Greek and Latin. That was the learning which in the middle ages chiefly gave distinction to the scholar. From that early day to the present time, the greater portion of year after year has been spent by every scholar, ambitious for *learning*, upon "Hic, hæc, hoc," varied by "*et* and; *cum* when," and the like. While those tongues were spoken, there was something to be gained by learning them, as they constituted the chief language of literature. The importance of a "classical education" is a fiction, or at least but little better. It is of priestly origin, and has of late descended from universities to "boarding schools," in which latter institutions much valuable time is spent in acquiring the merest smattering of this kind of learning, to be forgotten as soon as school is left. But the parent thinks that to keep up with the times he must have his boy "learn Latin."

The term "Learning" has come to be so misapplied that it would be well if it could be blotted out of the English Language. The primary idea attached to the word is a knowledge of the dead and gone languages of Latin and Greek. A man may be ever so well versed in the law, politics, chemistry, natural history, mathematics, commerce and mechanics, but if he does not understand "Greek and Latin," he is not a man of learning—he never has had a "Classical Education." He may be thoroughly acquainted with all the literature of the day, fully posted and far in advance even of the University "M. A's" and "L. L. D's" in the progress of the Sciences, but if he has not traveled in the same routine of "learning" marked out six or eight centuries ago—if he can't read Horace and Cicero in their original, dead languages, he is classed simply as "a self-educated man," and not entitled to University honors.

In early times "learning" was a word which, perhaps, had a proper signification. The principal use to which learning was then applied was to give intellectual employment to its recipients. The useful sciences and arts scarcely had an existence. Elegance and ease, were almost the universal condition of one class of community, and drudgery and toil that of the other. There was no middle class, to any extent. "Learning" was the chief distinctive feature of the one; and any effort to improve the condition of the other was never thought of—or if thought of was directly frowned upon as a dangerous innovation. In the days of Egyptian civilization this learning was confined to the priests and rulers. During the ascendency of Greece and Rome, it had become more universal; but it was not until long years after those nations had passed away, that the idea of elevating the condition of the working classes, through the aid, directly and indirectly, of science, began to gain ground; and still later that the principle of "universal education," found an advocate. The exclusiveness implied by the term "learning," and recognized in the practice of the "learned," of the present day, is but a relict of past ages, which it is fully time was buried out of our sight.

Education is comparatively a modern term. It is suggestive of progress. It embodies a practical idea. It consists in acquiring that class of information which is calculated to make a man—to make all men—useful, respectable and happy; and each one in that particular line of usefulness which he may have marked out for himself. Human knowledge, in modern times, has become so much more extensive in its range, than it was in past ages, that it is eminently proper we should economize our time in its acquirements, cut off everything which can be omitted without especial detriment, and seek mainly for that class of information which can be made most subservient to our happiness and usefulness. We must not be satisfied simply that any desirable requirement is useful, but we must show that it is the most useful of any yet unattained acquirement within our reach. Were this policy carried out in our schools and universities, we are inclined to think that it would eventuate in a radical change in the entire system of modern education. If we were to express this change in a single sentence, we would term it a change from the study of words and ideas to a study of things and realities.

The great object of education should be to understand one's business and duty in life. When a young men leaves college to take an active part in life how much assistance does he derive from one half of all that he has learned during the last six or seven years of his study? Unless he adopts teaching for his business, and that too, in the same routine through which he has just passed, it is but fair to say that one half of his study has been misapplied.

The business of society is not now carried on by literary men as in former times. The rapid progress in the direction of usefulness and happiness, which constitutes the chief feature of the present age, is not due to literature or a knowledge of the dead languages; but almost exclusively to the practical sciences of political economy, commerce, agriculture, mechanics, chemistry and natural history, branches which scarcely have a hearing in our colleges and academies. The land is full of *classical schools*, munificently supported, while the claims of industrial, or polytechnic schools, until quite recently, have scarcely been able to get a hearing, much less an endowment. The former have their value and should not be altogether neglected; but their place in public estimation and pecuniary consideration should be made most emphatically subservient to the latter.

It is a matter of sincere congratulation that a revolution in public sentiment in this respect, is in silent, but sure progress. Practical science is fast gaining ground in popular estimation over polite literature. This revolution is indicated by the organization of our Mechanics' Institutes, and Mercantile associations, which are coming into existence in all the principal cities throughout the land. These associations seem almost instinctively to prefer science to literature---the real to the ideal. The recent act of Congress making munificient donations of public lands for the establishment of this class of schools exclusively, is but evidence of the embodiment of this growing sentiment among the people. Another encouraging indication of the growth of this idea is the constant multiplication of class papers, devoted to the dissemination of useful information, in commerce, agriculture, mining, mechanics and all the useful arts and sciences. Knowledge is ever delightful to the human mind, but when that knowledge is made subservient to useful purposes, it is doubly valuable as well as most truly delightful. Such "knowledge is power."

Thirst and Hunger.—Every one is familiar with the fact that the animal system can bear up much longer under the influence of hunger than under that of thirst. The reason is that during abstinence from food the organism lives upon its own substance. The accumulation of fat feeds the system, which does not suffer materially until that source of sustenance is exhausted. During abstinence from liquid, the organism has no self-sustaining supply. Except when a person is placed in a very moist atmosphere, three days of deprivation of drink is usually the limit of endurance; while persons have been known to exist without food from fifteen to twenty days. Raging thirst is the most terrible infliction which can be visited upon man—it is far more terrible than starvation. The subjection to thirst is much more effectual in taming animals, than their deprivation of food.

Yankee Doodle.—Layard, in his last work on "Ninevuh and its remains" mentions "Yenghi-dunia," as the Persian name for America, "hence (he adds,) the origin of the name Yankee Doodle."—*Exchanges.*

The above is found in "Notes and Queries," a work of 12 volumes, which contains a mass of rare and curious information not elsewhere to be found. In a work on the "Round Towers of Ireland," the spelling of the Persian word is a little different—"Yanki-dooniah;" and the meaning is given, "Inhabitants of the new world." Perhaps, however, the variation in spelling corresponds with the difference in meaning of the two phrases.—*G. V. National.*

These efforts at Etymology remind one of Dean Swift's satire on the subject. Swift said that Archimedes got his name from his habit of lecturing maidens, to whom he was in the habit of frequently exclaiming, "Hark'e maids." From this circumstance that celebrated individual came to be called "Old Hark'e maids," which in time was corrupted into Archimedes. There is quite as much ground for the derivation claimed by the facetious Dean, as for that set up by "Notes and Queries,' as given above. In the numerous inflections which go to make up all languages, it is manifestly impossible that any two should be without similar sounds. The learned nonsense which was so severely rebuked by Swift, appears to be quite as common now as then.

Chemical Inventions are much less frequently announced in this country than in France or England, more particularly the former country. It is a matter of some surprise that our chemists do not turn their attention more especially to the field of useful invention in their particular department of knowledge. The field is certainly large and most inviting. The only recent invention of this description, for which our chemists can claim any great merit, is the vulcanization of Indin Rubber—an invention which has been of immense pecuniary advantage to the parties immediately interested, to say nothing of its great commercial value.

In another column will be found Prof. Everett's improved mode of smelting lead ore, for which letters patent have been taken out. The improvement promises to be one of considerable importance. It is to be hoped that these examples of success, in this direction, will induce our chemists to turn their attention more particularly in the direction of new discoveries.

Boulder Hill.—The Monitor *Gazette* describes as follows a singular mineral formation in the Monitor District, California:

The hill is separated by a ravine from Diamond Hill on the northwest, and by Eagle Gulch from the hill on the south. It is about three-fourths of a mile from east to west; and averages a half mile in width. It is completely covered with rich gold bearing quartz in the shape of boulders, two of which are estimated to weigh seven hundred tons; from one of them, rock was taken and worked in the arastra now in operation on the north side of the hill, which paid $80 to the ton. No ledge has yet been found in the hill, although a tunnel has already been run four hundred and fifty feet by the Scott's Hill Consolidated Tunnel Company, the contract for that distance having been just completed. These gold bearing quartz boulders are confined to this hill alone, none of the hills on either side having any upon their surface. And the crop apparently will last a 40-stamp mill a century. Wood, Marston & Dudley have an arastra at work in the gulch on the northwest side of the hill, in which they work about two tons of the rock per week, the yield from which has never varied much from $80 per ton, none of the silver being saved. The gold brings at the assay $14½ per ounce. The silver found in the rock upon assay being only about $2 per ton, the parties who are working it are not attempting to save it, as the cost would be about $8 per ton. The owners of this rich surface deposit have no prospecting to do; they have only to erect their crushing works and take out their piles. Luck is everything. The rock appears to have been subjected at some period to a great heat, which leads us to believe that it is a chimney from a monster ledge.

Since the inauguration of the Rebellion, about 600,000 brave lives have been sacrificed on the field of battle and its attendant incidents.

Mechanical Department.

HOME INDUSTRY.

We this week return to the branch of industry we started with; for doing which we need offer no apology, inasmnch as our ironworks, so far as the questions of capital and labor go, constitute the most extensive and important branch of industry amongst us; and for that reason, we are desirous of doing them all justice. It is true there are other manufactories in the city, creditable to us as a people, such as sugar, gas, marble, paper, glass, pickle, and chemical establishments, which we find exceed our own expectations, and if our friends will only have a little patience (for really it is quite a labor) we hope in the end to give them all satisfaction.

FULTON FOUNDRY.

These works were established in 1855, by the present proprietors, Messrs. Hinckley & Co., and have never, we understand, changed hands. They are not so large ns some already noticed, but in each department they are eqnally complete. They employ fifty-five hands, and consnme per month 108,000 ℔s. of iron for casting; 8000 ℔s. of wrought iron; 14 tons of coal for melting; 12½ tons of steam coal; and 3½ tons of forge coal per month, with a large amount of lumber for the usual purposes. Their largest casting weighs three tons, although tbey have a capacity for six. To meet the demands of their increasing business, the firm are putting up a splendid new engine of 26 horse power.

Their principal business is mill machinery of every description. A large proportion of the sawmills of the State, have been supplied with machinery from the Fulton. They are now manufacturing a large number of Prater's concentrators, which, in treating sulphuret ores, are acknowledged to be very effective. They are beginning to be extensively used, having already been introduced into such establishmeuts as those of the Ophir, Eclipse, and Hornitos Cos. and many other mills in the State, Territories and Mexico. We understand they give general satisfaction.

The Fulton has also turned out a large number of steamboat engines, the principal of which was for the opposition steamer "Annie Stewart," in praise of which it is unnecessary for us to speak. It is a poppet valve engine ot the Mississippi river style, and the first of the kind built in this State. They also manufacture stationary engines from six to 175 horse power.

This foundry enjoys a high reputation. The city is adorned with ornamental castings, and the State benefited, by the enterprise of its proprietors. We can personally bear testimony to the satisfaction their workmanship gives throughout our mining community. The visitor, whether it is his business to purchase, or inspect the works, will always receive at the Fulton the greatest politeness, and attention.

THE ATLAS FOUNDRY.

This establishment, situated on Fremont street, near Market, is of very recent date, being commenced only in May, 1864, by Messrs. Scott & Co., the proprietors, and is another glorious instance of the wonderful thrift and enterprise of our working mechanics. Though only two months old, it has taken a firm root in our midst, and judging from present appearances, promises to have a brilliant carcer. The works, of course, are still in a very incomplete condition; but they are evidently intended to be large and effective. They employ fourteen hands regularly, and have a capacity for casting seven tons. The first week they consumed 30,000 ℔s. of iron; and even now, when the "great strike" is over, and all our foundries again at work, their monthly consumption is quite large for so young a firm. This foundry is under the charge of Mr. Llewellen, one of the owners, a self-made, practical mechanic.

The principal object of interest here is a locomotive of 26-horse power, which they are building for Charles Minturn, one of our wealthiest citizens, to connect with his Petaluma steamer. In running order it will weigh about 10,000 ℔s., and cost about $5,000. They are also fixing up two freight cars, 20 feet long hy 8 feet wide, capable of carryiug 10 tons. The passenger cars were built hy Casebolt & Co., of this city, and are intended to possess every comfort and convenience. This is quite an enterprise, and reflects great credit on all concerned. It is well known that the steamer cannot run up to the town of Petaluma; so Mr. Minturn is building a rail-road three miles long, to connect the two; and San Francisco, represented by these spirited youug mechanics, supplies the principal material.

Such are the men who build up our country, and mature its growth with such rapidity. Of such our city, especially in this branch of industrial art, is full, and we congratulate our young friends, that they are thns soon associated with the great public works for which, as a people, we are justly celebrated. L. H.

HEAT AND FORCE.—In our last issue we gave some familiar illnstrations to prove that whenever heat is produced, it is in each measure to the force expended in recovering the friction. We now subjoin some additional facts illustrative of the conversion of force into heat:—

When a ball is discharged from a gnn and strikes an object, it is found that both the ball and the object struck, have risen in temperature. If the force is sufficiently great you cannot touch the ball, it is so hot; and just in proportion to the power of the gun will be the heat of the ball. If the power be sufficiently great, the heat may be so intense as to bring it to a white heat and melt the ball. The meteoric stones that sometimes fall to our earth may be regarded as balls, but moving with much greater velocity. They strike against our atmosphere with so much force that the force is converted into heat, so intense that they glow or become incandescent. Suppose our earth, in its revolution, struck against some opposing object like a target, what would be the consequences? The force would he converted into heat, and the velocity is so great—twenty miles a second—that would be immediately brought to the melting point. It would glow like the sun, and become a luminous body. The heat would be equal to that produced by the burning of fourteen earths made of coal. But this is not all. It would then fall into the sun, and would by its loss of momentum produce a heat four hundred times greater than before, and it would be seen on the sun's disc as a bright luminous spot. The force of the earth falling upon the sun would communicate a heat to the sun equivalent to the heat emitted by the sun in a century. It would serve as a fuel for that length of time. Now, the heat of the sun is most probably due to this source, the conversion of power into heat. It is probable that it is combustion. If the sun were composed of coal, it would last at the present rate only five thousand years. The sun, in all probability, is not a burning but an incandescent body. Its light that of a glowing molten metal rather than of a burning furnace. But it is impossible that the sun should constantly be giving out heat, without either losing heat or being supplied with new fuel. We know the heat of the sun. Each point is about thirty times hotter than the furnace of a locomotive, that is, a square foot of the sun's surface gives thirty times more heat than a square foot of grating in a locomotive. Yet the mass of the sun is so great that it would require three thousand five hundred solar systems, if made of coal, to account for the heat of the sun. Assuming that the heat of the sun has been kept up by meteoric bodies falling into it, and proof has been given of such fall, it is possible from the mass of the solar system to determine approximately the period during which the sun has shone as a luminary. On boarding a steamer you can on examining the hold for coals, and ascertaining its capacity, tell approximately how long she has been on her voyage. Limits can be set to the fuel of the solar system, and therefore limits can also be assigned to the existence of the sun as our luminary. The limits lie between one hundred millions and four hundred millions of years.

These are enormous periods, but still they are definite. The mass is so great, and the cooling is so slow, that, even on the supposition that no fuel was added, it might be five or six thousand years before the sun cooled down a single degree.

AN AGE OF STEEL.—We seem to he entering upon an age of steel. The recent improvements in the process of making steel bid fair so to reduce its price as to render its application practicable for a great number of purposes where wood and iron have heretofore been used. By the Bessemer process, steel can he made of almost any quality, hard or soft, by simply arresting the process at any particular stage. Steel cannon, steel shot and shell, steel boilers and steel ships, are now finding their way into use, being preferable to iron, in many cases, in consequence of their comparative lightness and durability.

THE PLOW.—It is not known where he who invented the plow was born, or where he died; yet he has effected more for the happiness of the world than the whole race of heroes and conquerors who have drenched it with tears and manured it with blood.

New Mode of Smelting Lead Ores.

Prof. A. H. Everett, of New York, has just brought to perfection a very neat improvement in the reduction of lead from galena, by which a considerable saving in expense is effected. One of the common methods of reducing this ore is to mix it with iron in a reverberatory furnace; the sulphur at a high temperature, having a stronger affinity for iron than for lead, leaves the lead and combines with the iron, forming sulphide of iron, while the lead is drawn off as a separate metal.

At the present time, however, the high price of even iron scraps (about $40 per ton) induced Prof. Everett to look about for some substitute, and it occured to him to try the waste tin scraps of the tin plate-workers; in these he has the very best of wrought iron, and in a form exposing the largest surface for the action of the sulphur. The tin scraps, being a waste product, can be had at a nominal cost. After a series of experiments the practical dificulties of the new process were overcome, and now several tuns of ore are being smelted by it daily at Prof. Everett's furnace, at the foot of Horatio street in this city.

The operation is extremely simple. Five hundred pounds of the sulphide of lead ore mixed with 125 lbs of tin scraps in a reverberatory furnace, and kept at an intense heat; the charge being stirred every 15 minutes. In from one to two hours the whole mass becomes fluid, and the reduction is complete. It is found best to introduce one half the charge of tin scraps, and allow it to become red hot, when the ore and the remainder of the scraps are added.

Besides the cheaper and more rapid reduction of the ore by this process, the tin of the scraps is mixed with the lead, increasing the yield, and for many purposes improving the quality. Prof. Everett has secured a patent for this valuable invention.—*N. Y. Exchange.*

THE HYDROSTATIC ENGINE of Mr. Hansbrow, a new invention which we have already described, appears to be attracting considerable attention in Sacramento. The inventor has had a working model constructed, with a cylinder of one inch diameter, and two inch stroke, which he designs sending to Europe. It has been tried, and with a pressure of only twenty-eight feet, made two hundred and ten revolutions per minute. Of several witnesses of the trial, who pride themselves on their muscle, not one could stop the engine. It will be exhibited in a few days in a public place, so that all may have an opportunity of witnessing it in operation.

A WATER CLEARER.—J. N. Andrews, connected with the Sacramento Water Works, says the *Star*, has invented a very simple apparatus for clearing and purifying our city water without filtering. In fact, the water is made to clarify and purify itself on philosopical principles—a beautiful illustration of the compensatory operations of nature. There is not an article of machinery about the apparatus that can possibly get out of order. It is consequently, ever in readiness to operate, and ever yields clear water. It is an invention that will be invaluable to all classes of citizens, and should become of general use.

FINE CLAY AS A DRESSING FOR SORES.—Dr. Schreber, of Leipzic, recommends the use of clay as the most "energetic the most innocent, the most simple, and the most economical of palliative applications to surfaces yielding foul and moist discharges." He moreover considers that it has a specific action in accelerating the cure. Clay softened down in water, and freed from all gritty particles, is laid, layer by layer, over the affected part to the thickness of about a line. If it becomes dry and fall off, fresh layers are applied to the cleansed surface. The irritating secretion is rapidly absorbed by the clay, and the contact of air prevented. The cure thus goes on rapidly. This clay-ointment has a decisive action in cases of fœtid perspiration of the feet or arm-pits. A single layer applied in the morning will destroy all odor in the day. It remains a long time supple, and the pieces which fall off in fine powder produce no inconvenience.

OUR STATE.—California contains as many square miles as the six New England states, and has a greater extent of sea coast than all the northern states bordering on the Atlantic. No state in the Union has such a diversity of soil—of extreme barrenness and extreme fertility; a climate in which all the products of tropics and temperate zones are blended; a land of inexhaustable mineral wealth; a home where the weary and disappointed from other lands can find peace and plenty, if they are lucky.

THE New Bedford Standard says both the locomotive manufactories at Taunton have been forbidden for the past six months to build engines for other parties than the United States.

Patent Department.

TAMPING BARS.—Abner Dobb, of this city, has obtained a patent for a tamping bar, which consists in arming the end of a common iron bar with copper, or an alloy of copper or other metal, which will secure the operator from the danger of premature explosion.

SCOVILL'S NEWLY INVENTED QUARTZ MILL, of which we gave a full description several weeks since, has been taken to Washoe, where it will be put up in the Silver State Reduction Works, at Empire City belonging to the Mexican Company. This mill will there be subjected to a thorough practical test as to its durability and effectiveness. It would be well for all inventors to thus subject their machines to a practical test at once. If they succeed, all is well; while if they fail the fact will the sooner become known, and much to the benefit of all parties.

A NEW CRUSHING MILL.—Mr. Fauchery, of this city, has made application, through the agency connected with this office, for a patent for a new Stone Crusher, which operates on a plan somewhat different from any now in use. The jaws are so arranged as to resemble an enormous pair of pincers, working crosswise, the motion being applied by an oval wheel or ear, made to revolve between the arms, closing the jaws at each revolution, the process of opening being managed by a spring. The machine has every appearance of being practical and effective. It is certainly simple and cheap in construction. It will be known as "The Croendile Machine," from the fact that its nameshe alone, of amphibious animals, makes use of both jaws in mastieating.

HINKLE'S IMPROVED QUARTZ MILL.—We have examined the drawings of the above mill, the invention of Mr. Philip Hiokle, of this city. The mill is designed upon an entirely new principle. A crushing machine is used for the first reduction of the rock to about the usual size of marbles. From this it passes into a reduction mill, which consists of a close iron cylinder, within which wheels, similar to the wheels of a Chili mill, are made to revolve with a rapid motion, accomplishing the work of reducing the ore to a fine pulp in a very short period of time. Mr. H. has an amalgamator and separator of peculiar construction attached to the mill, also of his own invention. Letters patent for inventions have been applied for through the agency connected with this office.

NEW MINING INVENTION.—The New York papers are calling attention to a new mining invention for separating ores, which is on exhibition in that city. The machine is known as "Stetefeldt's continuous concentrating machine. The machine is said to be an improvement on the old fashioned shaking-table and is said to possess the following advantages:—

1st. It discharges the concentrated ore continuously, so that it need not be stopped and emptied as is the case with shaking-tables.

2nd. It makes a remarkably clean division of the ore, discharging (for instance) Galena, Pyrites and Zinc Blende at their separate points, and obviating, almost entirely, the necessity of repeated dressings.

3d. It can be adjusted to suit any kind of ore and to accomplish any desired division, provided there be a difference of specific gravity between the substance to be separated.

INDIA RUBBER SHIRT COLLARS.—J. W. Smith, of Sale, England, has taken out a patent for the manufacture of shirt collars, cuffs, wristbands, etc., of vulcanized india rubber. Steel collars, we presume, will now be left entirely to the canine race.

A BELGIUM paper says that petroleum oil lamps are affected by music—a certain note on a brass instrument puts them out. M. Duhem extinguished eight lamps in succession by the sound of a trumpet. He was one of the late M. Jullien's band, and is professor at the Brussels Conservatoire of Music. These petroleum lamps, probably, were unable to appreciate the music of M. Duhem.

The Mining and Scientific Press Patent Agency.

OFFICE, 57, GOVERNMENT HOUSE, SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th 1861, and March 3d 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent? A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; it the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on prosecuting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing papers, attending to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues.—If the application is rejected we cause a thorough investigation to be made into the reasons prescuted to the Commissioner for refusing the patent. In making this examination, we have exceeding all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent, but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to favor us with the papers of our unsuccessful facilities securing favorable results. We have been successful in securing Letters-Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The laws requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail—The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the pateat is ordered to be issued, the applicant will be notified to remit the last instalment of the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicants case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 years and six months...	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	50
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who hears and reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appelant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Notice to James M Ross, or his Heirs:—You are requested to call at this Office, where information of importance awaits you. Said Ross left San Francisco, in June last, for Noyo Ills.

Before Cutting the Leaves of this journal, stitch each No. through the back, or fasten with a large pin, and you will have a paper in the most convenient form possible for reading or reference

We note with pleasure recent improvements in this publication. With the new year, it becomes a sheet of sixteen instead of eight pages, and has a more attractive typographical appearance. C. W. Smith, W. B. Ewer, and A. T. Dewey are the publishers under the title of Dewey & Co. We notice that several distinguished occasional contributors have been engaged to add to the interest and value of the paper. We wish the enterprising contributors continued success. Their influence in the relation to the mining interest of this Coast is excellent and important; and they deserve, as no doubt they will receive, a large patronage from a numerous public, interested in the development of mineral wealth.—*The Evangel, S. F.*

We desire to call the attention of our readers to the advertisement of the MINING AND SCIENTIFIC PRESS, published at San Francisco. It tells its own story, and leaves nothing for us to say, except that it is the best journal of the kind now published, and ought to be patronized liberally by the merchants, miners and scientific men generally on the Pacific coast. The editors are reliable gentlemen, and well qualified for the task they have undertaken.—*North San Juan Press*

Black Sheep.—James H. Shepard, having received subscriptions for this paper in May last, and failed to account to us for the money received, we are under the necessity of announcing him as a "defaulter." Parties holding his receipt, prior to this notice, for the PRESS will be supplied with the subscription due by addressing us.

We are pleased to welcome this excellent paper in its handsome new dress and enlarged proportions, the energetic proprietors having commenced its eighth volume with a double-sheet.—*Jone Chronicle.*

This valuable mining journal comes to us this week in a new dress and wears a very happy face. The improvements in that paper cannot but bespeak for it a liberal patronage of all those interested in mining—and who is not in this age and country?—*The Gleaner.*

Mr. A. T. Dewey, a journalist of experience, has become associated with Messrs. Ewer and Smith in the proprietorship and conduct of this paper. It inaugurated the new year by doubling its size and other improvements, and is now a first class journal for miners and mechanics, as well as for the general reader.—*Sacramento Daily Bee*

COMPLIANCE WITH LAW.

THE PHŒNIX

INSURANCE COMPANY,

WHEELER'S

Amalgamating and Separating Pans

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED THE principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

***These Pans may be seen in daily operation at the Miners, Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY ARE invited to call at Donahue's Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its centre and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the centre, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and centre of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamators can be seen running at Donahue's Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep21

Great Western Gold and Silver Mining Company.

Notice is hereby given, that there are delinquent upon the following described stock, on account of assessment No. one (1) levied Nov. 17th, 1863, and assessment No. two (2) levied March 17th, 1864 the several amounts set opposite the names of the respective share holders, as follows:

San Francisco, May 20, 1864. 21-4t

For Sale—A Useful Invention.—Editors Press:—I wish to call the attention of mill owners and manufacturers of mining machinery, through your columns, to a device of my invention for feeding the ores or materials to be crushed, in the common stamp mill, so much in use in this country. It is simple and efficient, doing the work with far more regularity than can be done by hand; it costs but little, and requires no more attention than can be given to it by some one about the mill, without neglecting his other duties. As I have not the means to introduce the above, I would like to enter into arrangements with some one to aid me, and share the profits of the invention. I would add, it has stood a working test, under my supervision, and has likewise received the approbation of Scientific men.

Any communications on the subject, addressed to J. C. H., El Dorado, El Dorado Co., Cal., will receive prompt attention. 21-4t

Coughs and Colds.—The sudden changes of our climate are sources of Pulmonary, Bronchial and Asthmatic Affections. Experience having proved that simple remedies often act speedily when taken in the early stages of the disease, recourse should at once be had to "*Brown's Bronchial Troches,*" or lozengers, let the Cold, Cough, or Irritation of the Throat be ever so slight, as by this precaution a more serious attack may be effectually warded off. Public Speakers and Singers will find them effectual for clearing and strengthening the voice. Soldiers should have them, as they can be carried in the pocket and taken as occasion requires.

Agents for California, Redington & Co., San Francisco. 23-1m

A New and Valuable Book.

PROCESS OF SILVER AND GOLD EXTRACTION, BY GUIDO Kustel, Mining Engineer and Metallurgist, former manager of the Ophir Works, &c.; 350 pages octavo illustrated.

This admirable work has met with the highest commendations from the Press and Scientific men, as a clear and able exposition of the science as practised in California and Nevada Territory. It is written for the people in good plain English and finely illustrated.

Price—post paid—Cloth $6; Sheep $7.

no30-tf San Francisco.

How to make your Remittances.—In most of the mining towns, brokers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Segregated Crown Point Mining Company, Gold Hill Mining District, Nevada Territory.

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, HAVING completed arrangements for its manufacture at the Fulton Foundry, in this city, now offers it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use. It is now in operation at

WHEELER & THAYER'S REDUCTION WORKS,

NORTH BEACH, SAN FRANCISCO,

To whom the Proprietors are permitted to refer, and where all interested in mining are respectfully invited to call and examine the best Concentrator in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

American and Foreign Patents.—Letters Patent for Inventors can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

INDEX TO VOLUME VIII

—OF—

The Mining and Scientific Press.

From January 1st to July 1st, 1864.

Containing Four Hundred and Eighty Pages.

WM. T. COLEMAN & CO.,
18v8 California and Front streets, San Francisco,

LLOYD'S NEW AMALGAMATOR
Is a Complete Success.

THE RESULTS OF THE WORK DONE BY IT DURING THE past week are:—From 300 pounds of tailings from Volcano, Amador county, worked for Mr. C. B. Culver, was obtained 6 oz. 12 dwts., equal to $40 to the ton of 2,000 pounds. The original ore was worked by the old Mexican arastra. From 6 0 pounds of tailings, the original ore having been worked by Professor Ryerson's Superheated Steam Machine, was obtained 15¾ ozs., Ryerson's machine having only got 5 ozs. to the ton from the ore.

Result from 50 pounds of ore from Amador county, worked for Mr. H. F. Williams, of Graves & Williams, of the Pacific Fruit Market, in this city, was obtained:

Gold	$73 33
Silver	42
To the Ton	$73 75

The assay being made by Messrs. Molitor & Co.

From 20 pounds of the same ore, worked for the same party, was obtained:

Gold	$63 30
Silver	04
To the Ton	$63 34

Assay made by Kellogg, Hewston & Co.

The mine from which the above ore was taken has turned out over $40,000 gold and silver, and the average yield as worked upon the spot, has only been $6 to the ton. Varney's Pan has obtained as high as $ 6 to the ton from this ore—the difference in favor of Lloyd's Amalgamator being over Varney's Pan, $53 54.2 per ton; and over the works at the mill, $62 54.2 per ton. Result from 15 pounds of ore from Queen City Company's claims, El Dorado Canon, Arizona Territory, worked for Mr. T. Mudge, who obtained: Gold, $ 19, Silver, $1.62, amounting to $2.71-100—equal to $361.33-100 to the ton—the assay being made by Messrs. Molitor & Co. Mr. Deetken, at his metallurgical works in this city, obtained by the Varney Pan $ 54 to the ton—the difference in favor of Lloyd being $207.33-100 to the ton.

Result of 85 pounds of ore from the Lady of the Lake Company, Leland Lode, San Francisco District, Arizona Territory, worked for C. W. C. Rowell, was obtained $7.44 in Gold, $0.25 in Silver—$7.69—equal to $2 6.18-100. Assay made by Messrs. Molitor & Co. 100 pounds of the same ore, worked by Wheeler's Pan, and assayed by Kellogg, Hewston & Co., yielded $7.58 00—equal to $151.60 to the ton. Difference in favor of Lloyd being $14.58-100 to the ton. Lloyd's is undoubtedly the best Amalgamator yet introduced, and is certain to supersede all other Amalgamators now in use. Communications for Mr. Lloyd, either for assaying or other machines, can be addressed to the care of Messrs. Kustell Brothers, Metallurgical Works, Bryant street, between Third and Fourth streets, San Francisco. 20v8-3m

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION OF THE Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. etbween 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.]
